I. INTRODUCTION.

When the Americans With Disabilities Act ("ADA") was enacted in 1990, it was hailed as an emancipation proclamation for the disabled.\(^1\) Passed with overwhelming majorities in both houses of Congress,\(^2\) the employment provisions of the Act were intended to open up job opportunities for the disabled so as to integrate them into the workplace. To increase access to the workplace, the statute not only prohibits discrimination but it requires employers to provide reasonable accommodations to the disabled, and to the extent the employment provisions of the statute generated any significant controversy during the congressional deliberations it was over the potential costs associated with the accommodation provision.\(^3\)

Fifteen years after its enactment, the experience under the statute has been quite different from what its advocates had expected, and likely from what its critics feared. Recent studies suggest that the employment levels of the disabled may have decreased since the passage of the Act.\(^4\)

\(^2\) The bill that became the ADA was passed by a vote of 377-28 in the House and 91-6 in the Senate.

\(^3\) As one example, coverage in the Wall Street Journal concentrated exclusively on the potential costs of the legislation, as well as its “astonishingly brief journey through the Washington process.” Albert R. Karr, Rights Bill for Disabled Seems Headed for Unusually Smooth, Quick Passage, WALL ST. J., Aug. 15, 1989, at A1; see also Jeanne Saddler, Small Firms Lobby to Revise Bill Helping the Disabled: Business Fear the Cost of Changes They Might Be Required to Make, WALL ST. J., Feb. 23, 1990, at B2 (emphasizing potential costs to small businesses); Albert R. Karr, Disabled-Rights Bill Inspires Hope, Fear, WALL ST. J., May 23, 1990, at B1 (“Some employers are worried about whom they may have to hire, but much of the opposition boils down to money.”).

\(^4\) See, e.g., Daron Acemoglu & Joshua D. Angrist, Consequences of Employment Protection? The Case of the Americans with Disabilities Act, 109 J. OF POL. ECON. 915
Interpreting the ADA

Several studies have also documented extremely low success rates among disability discrimination complaints filed in federal court. Part of the low success rate is attributable to a series of Supreme Court decisions that have sharply limited the scope of the statute. Yet, contrary to original expectations, the accommodation provision of the statute has generated relatively little litigation or controversy. Instead, much of the litigation (2001); Thomas DeLeire, The Wage and Employment Effects of the Americans With Disabilities Act, 35 J. OF HUMAN RESOURCES 693 (2000). Although the employment data are only tangentially related to this article, they have generated a considerable amount of controversy, so let me note that in addition to the flaws highlighted by others, these studies seem limited due to their lack of an explanatory theory. To suggest that the law has hurt those it was intended to help implies that there was a group of individuals, who required expensive accommodations, who previously obtained jobs that are no longer available to them. But if some employers have stopped hiring individuals for fear of the cost of accommodations, it leaves open the question how those individuals were obtaining jobs previously. Perhaps employers are more willing to provide accommodations voluntarily without the threat of legal sanctions, but just as plausibly, something is amiss with the story that is being told in the decline of employment, and that may be a poor analysis of the data. For two critiques of the economic studies see Peter Blanck et al., Calibrating the Impact of the ADA’s Employment Provisions, 14 STAN. L. & POL’Y REV. 267 (2003) and Samuel R. Bagenstos, Has the Americans with Disabilities Act Reduced Employment for People With Disabilities? 25 BERK. J. OF EMP. & LABOR LAW 528 (2004) (review essay). For a thorough discussion of the data sets and their limitations see Richard K. Burkhauser et al., Self-Reported Work Limitation Data: What They Can and Cannot Tell Us, 39 DEMOGRAPHY 541 (2002).

Ruth Colker authored two articles, based on published court decisions, demonstrating the limited success of plaintiffs in disabilities cases, which she later incorporated into a book. See Ruth Colker, The Americans with Disabilities Act – A Windfall for Defendants, 34 HARV. CIV. RIGHTS-CIV.LIB. L. REV. 99 (1999); RUTH COLKER, THE DISABILITY PENDULUM: THE FIRST DECADE OF THE AMERICANS WITH DISABILITIES ACT 69-95 (2005). Colker’s findings were largely replicated by two studies sponsored by the American Bar Association. See Study Finds Employer Wins Most ADA Title I Judicial and Administrative Complaints, 22 MENTAL & PHYSICAL DISABILITY L. REP. 403 (1998); John W. Parry, Employment Decisions Under ADA Title I B Survey Update, 23 MENTAL & PHYSICAL DISABILITY L. REP. 290 (1999). While the limits of relying on published opinions for empirical work are well known, no one has disputed the low success rate of disabilities claims, although it certainly may not be as low as the studies indicate.

The cases are discussed in section III, infra, and the cases most frequently cited as part of a judicial backlash are Sutton v. United Air Lines, 527 U.S. 471 (1999); Albertson’s v. Kirkinburg, 527 U.S. 555 (1999); Murphy v. United Parcel Serv., Inc., 527 U.S. 516 (1999); Toyota Motor Mfg. v. Williams, 534 U.S. 184 (2002); Chevron v. Echazabal, 536 U.S. 73 (2002). In addition, U.S. Airways, Inc. v. Barnett, 535 U.S. 391 (2002), is also frequently criticized by commentators, but that case involves the issue of accommodation – specifically when an employer must override a seniority system to accommodate a disabled worker – and will not be discussed in this article.

Courts have split over the proper legal standard to define an unreasonable accommodation with the dispute centering primarily on who has the burden of establishing what is reasonable. Cf. Vande Zande v. State of Wisconsin, 44 F.3d 538 (7th Cir. 1995) (adopting a cost-benefit approach) and Borkowski v. Valley Cent. Sch. Dist., 63 F.3d 131 (2d Cir. 1995) (rejecting cost-benefit analysis and emphasizing employer’s burden). Although the Vande Zande case has received considerable attention, in part because it was written by Judge Posner, the more plaintiff-friendly Borkowski standard
Interpreting the ADA

has focused on the preliminary statutory definition of who is disabled, a question courts have generally answered in a restrictive fashion.

Explaining this unusual turn of events is a complicated task. Within the academic literature, a consensus has emerged that the ADA has been the subject of a judicial backlash against the disabled, either because the Supreme Court is unsympathetic to their plight or as a means of restricting the statute’s potential costs. Professor Matthew Diller explains: “The term ‘backlash’ suggests a hostility to the ADA and toward those who seek to enforce it. The backlash thesis suggests that judges are not simply confused by the ADA; rather, they are resistant to it. It suggests that the courts are systematically nullifying rights that Congress conferred on people with disabilities.”

A cottage industry of scholarship has arisen around the judicial backlash theme to emphasize the Court’s narrow statutory interpretations and how the decisions deviate from Congressional intent.

In this article, I will offer an alternative story. While it is true that the Supreme Court has read the ADA narrowly, and in a manner that is generally inconsistent with congressional intent, I will contend that it is wrong to attribute that narrow interpretation to a judicial backlash. My thesis is that the Supreme Court has generally interpreted the statute consistent with congressional expectations even as it has deviated from those expectations as expressed in the statutory language, and more specifically in the legislative history. As discussed in more detail shortly, the overwhelming Congressional support for the statute obscured a broad Congressional indifference to the specifics of the legislation – Congress had a general intent to provide protection to the disabled without imposing excessive costs on employers. Beyond those general principles, Congress

has drawn more adherents among circuit courts. See Reed v. LePage Bakeries, Inc., 244 F.3d 254 (1st Cir. 2001) (discussing cases).

Matthew Diller, Judicial Backlash, the ADA, and the Civil Rights Model, 21 BERKELEY J. EMP. & LAB. L. 19, 22 (2000) (footnote omitted). Diller’s article was part of a symposium on the backlash thesis, and those articles were later collected in BACKLASH AGAINST THE ADA: REINTERPRETING DISABILITY RIGHTS (L. Krieger ed. 2003).

had few if any specific intentions, and the Supreme Court has effectively filled in the statute based on its own preferences, both ideologically and institutionally, as guided by reigning social norms. The statute the Court has constructed is not a bad statute, but it is certainly not the statute Congress passed. At the same time, it appears that the current Congress may prefer the Court’s reconstruction to the statute it originally enacted given that it has not sought to overturn any of the Court’s decisions.  

The attraction of the backlash thesis is understandable because it is a relatively simple story that feeds into the pervasive notion among academics that the Court has interpreted the statute consistent with its own conservative political preferences. But that story is too simple, as reflected in the important fact that most of the restrictive interpretations have been the product of a unanimous Supreme Court. Indeed, a closer look at some basic facts reveals the inadequacy of a simple story and why the ADA poses a unique challenge for explanatory theories. When it comes to the ADA, we have a statute that was passed with virtually unanimous support in both houses of Congress, with the strong support of a Republican President as well as broad public support, which has been rewritten in a restrictive fashion by a near unanimous Supreme Court without any subsequent efforts to overturn those decisions. That sequence of events is not easy to explain, and as will become clear, the Court’s decisions cannot be rationalized against any principled means of statutory interpretation.

As discussed in more detail below, the passage of the ADA, like its predecessor the Rehabilitation Act (“Rehab Act”), occurred through rather curious means. The statute was shepherded through Congress without significant controversy by a group of Congressional legislators all of whom had personal experience with disabilities, either in their own lives.

---

10 One indication of this preference is that there has been no movement within Congress to amend the ADA, even though many of what are generally considered the Court’s most pernicious decisions, such as Sutton v. United Airlines could readily be nullified by simple legislative action. The Sutton case, which involved the important question of whether in defining disability an individual should be evaluated taking into account any available mitigation measures, is discussed further in section III, infra.

11 The Court’s most criticized decision, Sutton v. United Airlines, was a 7-2 decision, with Justice Stevens and Breyer in dissent. All of the other cases that are typically associated with the backlash thesis were unanimous decisions.

12 Public opinion polls have long shown extremely high support for the ADA and the rights of the disabled more generally. For example, in 1991, 95% of those surveyed supported a prohibition on discrimination based on disability, and 83% supported requiring employers to provide accommodations. See Survey conducted by Louis Harris Associates, May 15-June 18, 1991, for the National Organization on Disability (available at www.ropercenter.uconn.edu/cgi). The support has been consistent over time. See Elaine B. Sharp, The Dynamics of Issue Expansion: Cases From Disability Rights and Fetal Research Controversy, 56 J. of Politics 919, 933 (1994) (discussing early polls and strong support for affirmative action measures).

13 See section IV, infra.
or with relatives, and the statute was enacted without the presence or aid of a substantial social movement. As a result, Congress passed an extremely broad statute, modeled after the Rehab Act, and then turned over its particulars to agencies and interest groups. And here is where the problems began. Rather than push for narrow legislation that would have protected the individuals Congress principally had in mind, the interest groups, along with interested Congressional staff, opted for broad statutory language that could have incorporated a much larger group of individuals into the statute’s scope — most of whom no one would have considered disabled prior to the passage of the Act. It could be argued that this is what legislation is intended to do, create protections for those who were otherwise invisible, but the individuals I am referring to — those who wear glasses, sustain workplace injuries, or are allergic to perfume — were never intended to be the subject of the legislation and there seems little public support for extending statutory protections to those individuals. Significantly, most of the restrictive statutory interpretations have arisen in cases involving non-traditional disabilities.

A predictable result of the Supreme Court’s narrow statutory construction designed to eliminate those unintended, and often frivolous claims, is that the Court also carved out a whole class of individuals who were intended to be covered by the statute, namely those whose disabilities can be controlled with medication, including those with epilepsy and depression, among others. While these decisions are problematic and contrary to the intent of the statute, I do not agree that they are the result of a backlash against those with disabilities. In fact, the Supreme Court, and lower courts have both been reasonably protective of

---

14 This issue is discussed in detail in section IV, infra.
16 See, e.g., Nese v. Julian Nordic Const. Co., 405 F.3d 638 (7th Cir. 2005) (plaintiff’s epilepsy was controlled by medication and therefore he was not disabled); Ristrom v. Asbestos Workers Local 34, 370 F.3d 764 (8th Cir. 2004) (individual’s treatable depression did not qualify as disability); Doyal v. Oklahoma Heart, Inc., 213 F.3d 492 (10th Cir. 2000) (same); Orr v. Wal-Mart Stores, 297 F.3d 720 (8th Cir. 2002) (diabetic not disabled). Many courts, however, have analyzed the particular circumstances to determine whether, even with mitigating measures, the plaintiff is disabled and have frequently found that the plaintiff was still limited in a major life activity, under the terms of the statute. See Lovejoy-Wilson v. NOCO Motor Fuel, Inc., 263 F.3d 208 (2d Cir. 2001) (epilepsy constitutes a disability); Lawson v. CSX Transp., Inc., 245 F.3d 916 (7th Cir. 2001) (diabetic substantially limited and therefore disabled); Head v. Glacier Northwest, Inc., 413 F.3d 1053 (9th Cir. 2005) (individual’s depression interfered with sleep thus qualifying him as disabled).
Interpreting the ADA

individuals with traditional disabilities\textsuperscript{17} – it is only the attempted expansion of the definition of disability that has been rejected. But as just noted, that rejection was entirely predictable. Without broad public support, without a strong social movement pushing to expand our notion of disabilities, it was simply too much to expect the Supreme Court to interpret the ADA expansively, or even to construe the statute consistent with congressional intent so long as the statute provided interpretive room for judicial discretion, which it did.

In this article, I will first explore the history of disability rights legislation to describe Congress’ general indifference to the substance of the ADA, and to explain that many of the controversies that have arisen over the ADA were also present with the Rehab Act. I will then analyze several of the Supreme Court decisions that have restricted the scope of the statute to again show that the Court’s actions were predictable and consistent with existing social norms relating to our perceptions of the disabled. In the final section, I will draw several lessons from the ADA case study, including how the decisions cannot be justified based on any principled theory of interpretation but might be better understood against the backdrop of positive political theory in which the Supreme Court is seen as a strategic actor seeking to impose its own preferences, only in this instance the Court appeared primarily concerned with institutional rather than political preferences. Finally, I will suggest that the absence of an effective social movement has severely limited the success of the statute, and has solidified the Court’s interpretations since Congress has faced no significant pressure to overturn the decisions.

II. Towards The Passage of the ADA.

Although the ADA is the latest statutory manifestation of governmental prohibitions on discrimination against those with disabilities, disability issues have long been on the governmental agenda. Social security provides payments to those who are disabled and unable to work, and beginning in the 1950s there have been concerted efforts to integrate the disabled both into the workplace and society more generally.\textsuperscript{18} Those efforts have varied over time, as have social attitudes towards the disabled, but it is important to stress that issues relating to the disabled have a long

\textsuperscript{17} See Bragdon v. Abbott, 524 U.S. 624 (1998) (finding asymptomatic HIV-positive individual covered by ADA). Another case, this one more surprising, in which the Court offered broad protection was Cleveland v. Policy Mgt. Systems Corp., 526 U.S. 795 (1999), where the Court held that an individual could pursue an ADA discrimination claim even while receiving disability social security benefits because the two statutes had different definitions of disability.

and complex history even while the comprehensive antidiscrimination protections are relatively new. In addition, disability issues are implicated in a variety of statutory schemes, including workers’ compensation, the Family and Medical Leave Act, as well as social security. schemes. In other words, the ADA forms one part of a complex regulatory scheme.

Before exploring the evolution of the ADA, it is important to highlight two fundamental issues that define and differentiate antidiscrimination protection for the disabled compared to other antidiscrimination mandates. First, unlike race, gender or age where the protected class is reasonably well defined, the ADA begins with a threshold question of who qualifies as disabled. As discussed in detail in the next section, defining disability has proved to be the most difficult judicial task and has, in turn, led to most of the controversial decisions. Both the ADA, and its predecessor statute the Rehab Act, rely on an unusual definition of disability, one that defines the disabled as an individual who has “a substantial limitation on a major life activity.”\(^{19}\) The statutes also provide protection for those who are “regarded as” disabled.\(^ {20}\) These definitions are quintessentially legal in nature, requiring interpretation of virtually every term without clear social norms to help guide those determinations. In general, there is a core notion of disability for which a broad consensus exists, a category that is often defined as traditional disabilities, but once we move beyond that core, there appears to be little consensus regarding who ought to be defined as disabled. Relatedly, the very heterogeneity of disability poses difficult interpretive and statutory problems. Disability can be permanent or temporary, it can arise at birth or from work-related incidents or other accidents, or develop later in life; some disabilities are visible, while many are not and different conditions affect individuals differently so what might be disabling in one person may not be to another. Together these factors complicate both the very notion of disability and statutory enforcement efforts.

There is another important way in which the issue of disability rights is distinct from most other antidiscrimination workplace mandates. For many, having a disability means having differential abilities that may render one less capable of performing certain jobs or functions unless the employer provides an accommodation. This is certainly not true of all disabilities but it is a background assumption underlying the need to provide accommodations to the disabled.\(^ {21}\) Although a rich literature has

\(^{19}\) 42 U.S. C. § 12102(2).

\(^{20}\) Id.

\(^{21}\) It should be noted that within the disability rights movement, the need for an accommodation is often seen as a social construct, that society has been constructed around a limited norm of ability. See, e.g., Kay Schriner & Richard K. Scotch, *A Human Variation perspective on Overcoming Oppression*, 12 J. of Disability Pol’y Studies 100, 100 (2001) (“One key rationale for the ADA was that many of the problems associated with having a disability were not inevitable products of impairment, but rather
Interpreting the ADA

developed over the accommodation mandate contained in the ADA, in particular how that mandate is similar to other mandates contained in antidiscrimination statutes, there is little question a public perception exists that disability accommodations are both necessary and potentially costly. Indeed, the public debate on the ADA focused almost exclusively on the costs of accommodation, rather than on the more important threshold question of who will qualify as disabled.

These two differences – the need to define the class and the accommodation requirement – obviously run together. The broader the class, the greater the accommodation burden will be. It is also possible that the broader the class becomes, the less force the antidiscrimination mandate will have, particularly if the class is stretched to include individuals society would not otherwise identify as disabled. Relatedly, an expansive class may diminish support for the accommodation mandate, especially if employers are asked to provide costly accommodations for all manner of health conditions. So although the issues of definition and were the result of a socially constructed environment that arbitrarily and perniciously excluded or limited social participation.

Given that the statute includes an accommodation requirement as well as means for employers to avoid having to accommodate some disabilities, it is not clear that it is accurate to say that this concern motivated the ADA. Nevertheless, there is no question that within the disability community, this was one of the intended purposes, and one that the statute has likely not influenced, as discussed in more detail in section IV. For an extended treatment of the social model see Ravi A. Malhotra, The Legal Politics of Globalization and Workers With Disabilities in Canada and the United States (dissertation on file with the author).

This was apparent in the major newspaper coverage of the statute, almost all of which focused on the potential cost of accommodation, often in the area of public services. See note 3 supra. To the extent there was any discussion regarding the potential breadth of the statute, it involved the incorporation of AIDs into the definition of disability. For a sampling of the newspaper coverage see Susan F. Rasky, How the Disabled Sold Congress on a New Bill of Rights, N.Y. TIMES, Sept. 17, 1989, at D5; Marlene Cimons, Far-Reaching Bill to Protect Disabled from Discrimination Gains Speed, L.A. TIMES, July 30, 1989, at A6; Steven A. Holmes, Rights Bill Sent to Bush, N.Y. TIMES, July 14, 1990, at A6; Sharon LaFraniere, Doors Opening for the Disabled, WASH. POST, May 25, 1990.
accommodation are typically treated as distinct, they are closely related and over the last decade the Court has expressed a strong interest in the definition of disability without devoting substantial time to the potential costs of accommodation. With those background presumptions in mind, I will now explore the origins of the federal statutes relating to disability in the workplace.

A. The Passage of the Rehab Act.

Both the Rehab Act and the ADA were passed by Congress under unusual circumstances. Both acts received widespread support within Congress – the ADA passed with overwhelming majorities in both houses – despite serious opposition from the business lobby. This was true even though at the time the Rehab Act was passed in 1973, the disability community formed only a loose advocacy coalition without substantial legislative experience. By the time of the passage of the ADA, much had changed although the disability community remained a loose confederation of groups primarily focused on specific disabilities and often with conflicting agendas. The passage of the Acts, which came in the face of simultaneously broad congressional support and widespread congressional indifference, helps elucidate some of the eventual problems that have arisen during the first decade of ADA implementation.

The Rehab Act was primarily staff-driven legislation, in which a handful of congressional staff members succeeded in ensuring the bill passed without much legislative attention, and then later helped to shape its direction by crafting extensive regulations. As historian Ruth

---

24 In its decisions, the Court has addressed the issue of accommodation on two occasions, neither of which involved cost issues. In US Airways v. Barnett, 535 U.S. 391 (2002), the Supreme Court held that, in the ordinary course, employers were not required to override a seniority system as a means of accommodating a disabled worker. At issue was the importance of seniority in a workplace and neutral workplace rules, but the case did not turn on the cost of the accommodation, which would have been trivial. The other case that implicates the accommodation mandate involved the professional golfer Casey Martin who sought to use a golf cart on tour, a claim that was filed under the public accommodation provisions and which again did not involve any direct costs. See PGA Tour, Inc. v. Martin, 532 U.S. 661 (2001) (finding that Martin and golf tournament were covered under the ADA and Martin was entitled to an accommodation).

25 One example is that wheelchair advocates seek ramps although those ramps can make it more difficult for blind individuals to get around. Similarly, much of the deaf community has explicitly fought against assimilation into the hearing culture.

O’Brien noted, the Rehab Act, also known as section 504, arose “without much forethought,” it just emerged.27 Despite its stealth nature, President Nixon twice vetoed the Rehab Act, although it was ultimately enacted in essentially its current form. That form offers a very short directive applicable to the federal government and those receiving federal financial assistance.28

When the statute was initially passed, it contained a vague definition of handicap, the term that was in use at the time. During the following year, a more comprehensive definition was fashioned at the agency level, and the statute was amended in 1974 to incorporate the definition that continues to define disability today.29 The definition of handicap was, and the definition of disability is:

“Any person who (A) has a physical or mental impairment which substantially limits one or more of such person’s major life activities, (b) has a record of such an impairment, OR (c) is regarded as having such an impairment.”30

This definition requires virtually every term to be interpreted: substantially limited, major life activity, and what it means to be regarded as having an impairment. After several years of delay, administrative regulations were developed to provide some guidance for interpreting the provisions of the Rehab Act,31 but perhaps more important to the evolution of disability rights was the open-ended language that went to the core of the statute’s scope.

27 O’BRIEN, supra note 26 at 118. Sociologist John Skrentny has explained the development of section 504 in a similar fashion: “There were no details or explanations as to what [the statute] would mean and what limits might be on the potential remedies for exclusion. Section 504 was simply a part of the politicians’ repertoire for addressing a group that they saw as analogous to black Americans. No one paid any attention to what would become a revolutionary new policy. There was never any discussion of Section 504.” JOHN D. SKRENTNY, THE MINORITY RIGHTS REVOLUTION 270 (2002).

28 The language of section 504(a) is: “No otherwise qualified individual with a disability in the United States, as defined in section 7(20), shall, solely by reason of her or his disability, be excluded from the participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance or under any program or activity conducted by any Executive agency or by the United States Postal Service.” 29 U.S.C. §794(a) (as amended).

31 The regulations were held up by the Reagan administration and were promulgated following several high profile protests where disabled individuals occupied offices of the responsible agency. See SCOTCH, supra note 26, at --.
As noted previously, the need to define the protected class renders disability statutes different from other antidiscrimination statutes, and there is no easy way to define disability, or at least no easy way that will garner consensual support. One possible approach would be to list certain conditions or disabilities that qualify for coverage but this approach would have the substantial disadvantage of requiring amendments any time a new disabling condition arose. Given the way Congress, or any legislature operates, it was therefore important to adopt language that was sufficiently open-ended to allow for necessary evolution. Another approach might be to provide a non-exclusive list of qualifying conditions while leaving courts to determine whether conditions that are not included on the list should be covered disabilities. This was, in fact, the approach taken in the regulations that were promulgated under the Rehab Act, although those regulations were not ultimately incorporated in the statutory language of the ADA.

Not only is it difficult to define disability, but there is a significant dispute over what constitutes a disability, or how disability ought to be defined. The disability rights community generally favors a broad definition, one that is distinctly inclusive. Part of the impetus for a broad definition appears to stem from a desire to destigmatize the concept of disability: labeling more people as disabled may destabilize the existing norms regarding abilities and what it means to have a disability. While this might be a sound political project, it makes for a difficult legal one. A broad definition, for example, might dilute the meaning of disability, particularly if virtually any individual can be defined as disabled, and it might also open the door to frivolous claims by individuals seeking to take advantage of an opportunity to enter the federal courthouse. This in turn might alter the public support for disability rights, especially taking into account the cost concerns that accompany the accommodation mandate. Indeed, a broad definition is likely to fuel additional concerns about imposing excessive costs on businesses. At the same time, there is little question that the prospect of a broad and inclusive definition enlarged the advocacy community for the statute and ultimately the push for a broad definition prevailed.

32 This is true even within federal statutes because of the varying contexts. For example, the statute that governs education of the disabled focuses on functional issues relevant to schooling. See Mark C. Weber, Reflections on the New Individuals With Disabilities Education Improvement Act, 58 Fla. L. Rev. 7 (2006).
34 For an influential approach along these lines see MARTHA MINOW, MAKING ALL THE DIFFERENCE: INCLUSION, EXCLUSION & THE AMERICAN LAW (1990); see also Burgdorf, at 539-44 (critiquing judicial restrictions of disability definition).
35 See SWITZER, supra note 26, at 101 (noting that some of the statute was expanded to increase political support).
With this background in mind, three related aspects of the passage of the Rehab Act are noteworthy as they relate to the eventual passage of the ADA. First, the Rehab Act was pushed by a handful of Senators with a deep interest in the subject who met very little opposition within Congress. This intense but small support allowed interested congressional staff, and later agency staff, to shape the legislation without significant vetting or compromise. Second, the bill was adopted without much public input, and without the development of any substantial social movement that may have helped increase both public awareness and a societal commitment to disability rights. As a concept, there is very little opposition to providing rights to the disabled; however, as evident by the two Presidential vetoes of the Rehab Act, there are substantial concerns regarding the costs that might accompany those rights and once the legislative initiative slides closer to the “special rights” or affirmative action category, public support weakens substantially. Third, and directly related to the cost issue, the government’s interest in providing disability protections is multifaceted and its varied interests can lead to conflicting statutory goals. To be sure, there is a strong desire to prevent discrimination against the disabled, as well as a desire to aid their quest to enter the workplace so that they can obtain the benefits that employment provides. The government, however, also has a different and distinct interest because moving disabled individuals into the workplace will often move them off the public welfare roles. It is not always clear how this interest plays out, but it is another factor that makes disability different from other protected categories and may explain why these statutes faced so little opposition within Congress.

36 See SCOTCH, supra note 26, at 150-51.
37 Linda Krieger has noted, “[B]y the time the ADA was passed relatively little popular consciousness raising around disability issues had taken place.” Linda Hamilton Krieger, Sociolegal Backlash, in BACKLASH AGAINST THE ADA (L. Krieger ed. 2003); see also SHAPIRO, supra note 26, at 117 (“The fight for disability rights was a largely invisible, almost underground, movement.”).
38 See polls cited earlier note 12. In his work, Skrentny has concluded that, “Among all the groups who were part of the minority rights revolution . . . Americans – or at least their government leaders – see disabled Americans as the most deserving.” SKRENTNY, supra note, at 274. Obviously, this is a broad statement and there are many exceptions, including the infamous Buck v. Bell and the eugenics movement. See Buck v. Bell, 274 U.S. 200 (1927).
39 See Kelman, supra note 22. The Rehabilitation Act, in fact, contains an affirmative action component requiring the federal government and those with federal contracts that exceed $10,000 to establish affirmative action programs for the disabled. See 29 U.S.C. §§ 791 & 793.
41 A similar interest overhangs age discrimination, and Congress has, in fact, moved back the age of retirement as a way of limiting the costs of social security. See Sara E. Rix, The Aging of the American Workforce, 81 Chi.-Kent L. Rev. 593, 602-03 (2006) (discussing increase in retirement age to 67 and its implications).
B. From the Rehab Act to the ADA: the Rehab Act Cases.

Although the ADA has generated a tremendous amount of controversy and litigation, the Rehab Act was a very modest statute that failed to generate a substantial body of case law. To offer one example, between 1973 and 1984, a total of 360 cases mentioning the Rehabilitation Act appeared in the LEXIS appellate court file, and most of those cases did not involve the substantive aspects of the act but instead focused on various jurisdictional issues. There were, in fact, very few cases interpreting the definition of handicap. In contrast, a similar search for the single year 1997 turned up more than 900 appellate cases mentioning the ADA, a substantial number of which involved the very definition of disability.44

Even though the case law was sparse, many of the issues that have surfaced with the ADA were also present under the Rehab Act, and examining these cases demonstrates that courts approached the issues quite similarly. For example, the first case the Supreme Court decided on the merits of the Rehab Act, Southeastern Community College v. Davis, exposed many of the contemporary tensions that remain prominent in the disability rights debate. The case involved a deaf nursing student who was seeking accommodations from the college for her studies; the Supreme Court, however, found that she was not qualified for the position because she would be unable to perform the functions of a nurse, and as a result, the college was under no obligation to accommodate her disability. In arriving at this conclusion, the Supreme Court rejected an agency interpretation as inconsistent with the statutory language, and also rejected the statements of interested members of Congress. The unanimous opinion also distinguished between affirmative action

42 The search was a very simple one “Rehabilitation w/2 Act” and date (bef 1985). Much of the case law involved educational issues and questions as to whether a private right of action existed under section 504 and whether the federal financial assistance had to be in a program related to the plaintiff.
43 To be sure, there were some isolated successes particularly in district courts. See, e.g., Davis v. Bucher, 451 F. Supp. 791 (E.D. Pa. 1978) (individual with history of drug use qualified as handicapped); Vickers v. Veteran’s Administration, 549 F. Supp. 85 (W. D. Wash. 1982) (individual with hypersensitivity to tobacco smoke handicapped). But for every successful case there were an equivalent number of failed claims. See, e.g., Tudyman v. United Airlines, 608 F. Supp. 739 (C.D. Cal. 1984) (overweight individual not handicapped); De la Torres v. Bolger, 610 F. Supp. 593 (N.D. Tex. 1985), aff’d 781 F.2d 1134 (5th Cir. 1986) (left-handed individual not handicapped).
44 The search in the LEXIS appellate database was “date (is 1997) and disability! and employ!” and produced 994 cases. This statistic is not meant as anything other than a rough comparison, as it was done nonscientifically and the nature of the reporting services has changed so that many more unreported decisions are now available electronically.

Interpreting the ADA

obligations, which were not at issue in the case, and the statute’s equal
treatment mandate.\textsuperscript{48} All in all, as will become clear shortly, the Court’s
decision had much in common with the contemporary cases decided under
the ADA.

That was also true of the Court’s next case, \textit{Alexander v. Choate},
although this case was decidedly more mixed in the benefits it offered to
the disabled.\textsuperscript{49} Like \textit{Davis}, \textit{Choate} was not an employment case, but
instead involved a challenge to a limitation on Medicaid reimbursement
for hospital stays. An important part of the case concerned whether the
Rehab Act permitted disparate impact challenges, which the Court
answered affirmatively.\textsuperscript{50} However, in another unanimous opinion, this
time written by Justice Marshall, the Court also expressed a “desire to
keep § 504 within manageable bounds,”\textsuperscript{51} noting further that the statute
did not guarantee equal results.\textsuperscript{52} Under these principles, the Court
ultimately upheld the challenged regulation.\textsuperscript{53}

If the first two cases were setbacks to a broad definition of
disability, the third case may have appeared to open the door to an
expansive judicial approach. In \textit{School Bd. of Nassau County v. Arline},
the Supreme Court held that contagious diseases, in this case tuberculosis,
fell within the scope of the statute, either under the definition of disability
or under the “regarded as” language.\textsuperscript{54} The \textit{Arline} case was undeniably
significant, and it almost certainly sealed the subsequent decision to
incorporate the Rehab Act’s definition into the ADA if for no other reason
than the case was decided during the Act’s development in Congress.\textsuperscript{55}
At the same time, the success of \textit{Arline} may have obscured some of the
fundamental differences between the two statutes that would render an
open-ended definition of disability less suited to a more comprehensive
statute like the ADA, as well as the pattern of prior restrictive decisions
that had arisen under the Act. In addition to the cases discussed, Congress
also passed three statutes in 1986 to override three Supreme Court
decisions involving the rights of the disabled. In these statutes, Congress
overturned restrictive interpretations as applied to air carriers, sovereign

Interpreting the ADA

immunity issues, and education remedial issues. Contrary to the stated views of most disability advocates, very few cases brought under the Rehab Act sought to expand the definition of disability to include non-traditional disabilities, and those few cases typically failed.

As a result, by the time the ADA deliberations began, the Rehab Act offered a rather weak model for implementing broad disability protections. If anything, the experience under the Rehab Act should have offered caution, rather than unbridled optimism, about the future course of disabilities law, particularly in the context of a disabilities statute that left substantial room for judicial interpretation. Indeed, as Professor Charles Craver has emphasized, the plaintiff ultimately lost her claim in Arline because it was determined that her disease rendered her unqualified to teach.

C. The Passage of the ADA.

The ADA was introduced in Congress in the late-1980s at the behest of a number of members who had particular experience with disabilities. The primary house sponsor Tony Coehlo suffered from epilepsy and had been subjected to discrimination in his youth as a result of his condition. In the Senate, Tom Harkin, whose brother was deaf, took the lead, where he was joined by many other influential Senators who also

57 As noted, very few such claims arose in the appellate courts, and I could not find any claim involving high blood pressure, chemical sensitivity, or some of the other cases that have arisen with frequency under the ADA. At the time of the Rehab Act, the claims that sought to stretch the statutory definition involved mental disabilities such as depression, which was less well accepted as a disability at the time. See, e.g., Doe v. Region 13 Mental Health-Mental Retardation Comm’n, 704 F.2d 1402 (5th Cir. 1983) (employee’s depressive neurosis rendered her no longer qualified for her job); Hart v. City of Baltimore, 625 F.2d 13 (4th Cir. 1980) (claim of disability relating to chemical imbalance abandoned at oral argument). On the flip side, some of the conditions that are now litigated, were accepted as disabilities without question under the Rehab Act. See Bentivegna v. U.S. DOL, 694 F.2d 619, 621 (1982 ) (diabetic unquestionably handicapped under the Rehab Act).

58 Chai Feldblum has argued that at the time of the ADA, the courts’ interpretations of the Rehab Act had been generally favorable to an expansive interpretation. See Chai Feldblum, Definition of Disabled Under Federal Antidiscrimination Law: What Happened? Why? And What We Can Do About It? 21 BERKELEY J. EMP. & LAB. L. 91 (2000). Looking at the cases she relies on suggests that many, and perhaps most, of the claims involved traditional disabilities and were not particularly difficult cases. What would be important to know is whether certain conditions or impairments were defined as a disability under the Rehab Act that are not so defined under the ADA. Even then, it is important to keep in mind that extending the Rehab Act into the private sector would create new issues for courts compared to the relatively obscure Rehab Act.

had personal experience with disabilities -- Senator Kennedy had a sister who suffered from mental retardation, Bob Dole lost the use of his right arm in the military, and Senator Orin Hatch’s brother-in-law suffered from polio. These and other members would play critical roles in ensuring the passage of the ADA, and perhaps because of the personal connections to issues of disability, there was virtually no opposition to the ADA in either the House or the Senate.

Among advocates, the lack of opposition is almost always seen as desirable because it speeds the bill’s journey through the legislature. The lack of controversy, however, can just as easily lead to problems during the implementation of the statute that might have been addressed through more careful congressional deliberation. This was particularly true in the context of the ADA, which arose at an unusually complex time concerning the interaction between Congress and the courts. At the time the ADA was passed, Congress was largely receptive to the demands of civil rights groups, while the Court was not, resulting in a situation in which the courts, if given an opportunity, could readily take away what Congress had provided. This tension between the branches should have counseled in favor of clear statutory language designed to limit judicial discretion. Yet, rather than crafting specific language that would tie the Court’s hands, the disability community quickly opted to import the broad definition of disability from the Rehab Act into the ADA. It is quite possible that this move simply proved too irresistible given that it would be difficult for Congress, or the statute’s opponents, to object to a definition it had already adopted. At the same time, there were many reasons why a broad definition that relied on judicial interpretation would prove problematic for the ADA.

Perhaps most significantly, a broad definition of disability was in clear tension with the tenor of the Supreme Court at the time. An open-ended and potentially expansive definition of disability would have its best chance to succeed with a Court that was sympathetic to the statutory goals or perhaps one that was determined to remain faithful to the congressional language. Yet, in 1988-89 when the ADA was debated in Congress, there was no reason to see the Supreme Court as sympathetic to any aspect of civil rights. The Civil Rights Acts of 1990 and 1991 were designed to overturn a series of hostile civil rights decisions, and there was no reason to expect the Supreme Court of the early 1990s to interpret the ADA any

---

60 See SHAPIRO, supra note 26, at 117-19. In addition to the Congressional members, President Bush had a son with a severe learning disability, and Attorney General Thornburg’s son suffered significant head injuries in an accident. Id. at 119.

differently than it had interpreted Title VII. In fact, there was reason to expect that the Court might treat the ADA even more hostiley, since the ADA did not have the broad public support of Title VII, nor did it have a lobbying arm as powerful as the AARP with respect to the ADEA, or the traditional civil rights groups such as the NAACP for Title VII. The ADA was also a new and innovative statute that posed issues to which a conservative court would naturally be skeptical, in large part because of the explicit cost considerations embodied in the accommodation mandate. After all, the Supreme Court’s evisceration of the disparate impact standard in the notorious *Ward’s Cove* case, which prompted the Civil Rights Act of 1991, arose primarily due to a judicial concern with the costs the impact standard imposed on employers. Looking to Title VII, then, as opposed to the Rehab Act, there was no reason to expect the Supreme Court would be receptive to the far-reaching and novel aspects of the ADA, and this was true even before the onslaught of frivolous disability claims that later emerged.

At the same time, while the Supreme Court appeared to be in a manifestly hostile mood towards civil rights, Congress’s disposition was almost exactly the opposite. In detailing the history of the passage of the ADA, one of the lobbyists noted that it was a very difficult time to move civil rights legislation through Congress, but historically this was deeply inaccurate. The Congress that passed the ADA was among the most prolific in our nation’s history in passing Civil Rights legislation, and undoubtedly the most prolific since the mid-1960s. During the time the ADA was under consideration, Congress passed the Civil Rights Restoration Act of 1987 (to overturn a Supreme Court decision), the Family Medical Leave Act, ultimately three times because of two presidential vetoes, substantial amendments to the Fair Housing Act, an important Age Discrimination bill, a revision of the Rehab Act, as well as the Civil Rights Acts of 1990 and 1991. If ever there was a time for passage of civil rights legislation, it was in the late 1980s.

All of this legislative activity came with a downside that was particularly problematic for the ADA. Of all the civil rights statutes that

---

62 See William N. Eskridge, *Overriding Supreme Court Statutory Interpretation Decisions*, 101 YALE L.J. 331, 333 n.4 (1991). This is a part of the ADA story that is often overlooked by those who focus on the limitations of the ADA, without thinking more broadly about other civil rights statutes. The ADA was considered in Congress at the same time the highly controversial Civil Rights Acts of 1990 and 1991 were being debated, though virtually all of the public attention, and controversy, were focused on the Civil Rights Acts rather than the ADA.

64 *Switzer*, *supra* note 26, at 86.

were passed towards the end of the decade, the ADA proved among the least controversial. The Family and Medical Leave Act ("FMLA") was vetoed twice by President Bush; the Civil Rights Act of 1990 was likewise vetoed, and the Civil Rights Act of 1991 was headed for a veto until the Clarence Thomas hearings intervened. As a consequence, all of these statutes received more congressional attention, and more legislative massaging than the ADA. The Civil Rights Act of 1991, for example, provided very specific statutory language that has guided the Supreme Court in a more moderate direction over the last decade.

The lobbying community also made an important tactical decision that may have further limited the possibility of an expansive interpretive approach to the statute. Early in the process the lobbying community decided not to mount a large publicity campaign for the ADA or to rally broad public support for the statute but instead decided to work solely within Congress. This decision was primarily due to a sense that public support for the statute was unnecessary and might stir up unwanted opposition. Congressional support for the statute was strong, and there was very little open opposition within Congress to the goals of the ADA. What little opposition there was centered on questions relating to homosexuality, and a handful of conservative members of Congress criticized the potential scope of the Act but to no persuasive effect. In light of this broad support, the business lobby also decided early in the

---

68 As a young attorney with the Lawyer’s Committee for Civil Rights, I participated in the drafting of the Civil Rights Act of 1991. The bill was effectively stalled until the Clarence Thomas hearings brought attention to discrimination issues, in particular to the lack of damages for sexual harassment that did not result in the loss of a job. Senator Danforth, who was simultaneously shepherding his former aide Clarence Thomas through his contentious hearings while serving as the Republican leader on the Civil Rights Act, pledged to ensure passage of the Act regardless of the outcome of the confirmation hearings. With his leadership, the act passed the day after the hearings concluded without any significant legislative record being developed. For a similar recollection see Roger Clegg, A Brief Legislative History of the Civil Rights Act of 1991, 54 LA. L. REV. 1459, 1469-70 (1994) (labeling the Thomas hearings as a “breakthrough” for the passage of the Civil Rights Act.).
69 See discussion infra note 155 and accompanying text.
70 See SWITZER, supra note 26, at 107 ("Avoiding the media and any attempt to try to explain the legislation to the press became a key element of the fight for passage of the ADA.").
72 For discussion of the limited opposition see Wendy F. Hensel & Gregory Todd Jones, Bridging the Physical-Mental Gap: An Empirical Look at the Impact of Mental Illness Stigma on ADA Outcomes, 73 TENN. L. REV. 47, 58-59 (2005) and Burgdorf, supra note 9.
process to deescalate its opposition and to instead focus on fashioning a bill it could live with.\textsuperscript{73}

The decision by the lobbying community to produce a statute under the public radar ultimately proved a mistake, and likely a serious one. Without broad public support, without a coherent social movement pushing an expansive agenda, there was little reason to expect that the ADA could, by legislative fiat, expand the definition of disability to include those with nontraditional disabilities. Not only was there no apparent public support for an expansive approach to disability, but the statute’s normative force was never adequately articulated. There was, for example, no public discussion of why the ADA did not involve “special rights,” why the accommodation mandate was a product of right and equity rather than special treatment akin to affirmative action, or why disability rights ought to be seen as equivalent to earlier civil rights movements. In a recent article, Professor Michael Stein notes that many continue to view the ADA as involving special rights, but without a social movement to change that perception, there was very little the legislation could do to alter the public consciousness.\textsuperscript{74} More was needed than new legislation, and that more never materialized. Instead, the disability rights community feared a public dialogue and sought refuge in the courts, the wrong place, by almost any measure, for refuge.

Had there been a public dialogue, it is also quite likely that the disability community would have opted for a more narrow statutory definition because the community would have been required to advocate a basis for the statute, a basis that would have likely stemmed from discrimination, structural barriers that could be alleviated, or the needs of the disabled. This may have also focused the advocacy community on justifying a broad definition of disability or to confront some of the many issues that have subsequently arisen, such as whether temporary disabilities, or disabilities that arise out of work, are deserving of statutory protection, or whether individuals with rather minor conditions, such as allergies, ought to be treated as disabled. The advocacy community, in fact, seemed fully aware of this problem, and its efforts aimed at ensuring passage of the Act all focused on traditional disabilities. Indeed, virtually all of the public displays and protests relating to the ADA suggested a relatively narrow definition of disability, one that emphasized traditional disabilities, and one that is consistent with the later court interpretations. Deaf students at Gallaudet University mounted highly visible and successful protests calling for a deaf University President, disabled

\textsuperscript{73} See Paula Yost, Business Not Fighting Bill for Disabled, WASH. POST., at A12, Aug. 19, 1989 (explaining that business lobby decided to work towards a more palatable bill rather than opposing it outright).

\textsuperscript{74} Michael Ashley Stein, Same Struggle, Different Difference: ADA Accommodations as Antidiscrimination, 153 U. PENN. L. REV. 579 (2004).
individuals crawled up the Capitol building to demonstrate its lack of accessibility, while others tied themselves to buses and engaged in similar protests centered around traditional disabilities. The members of Congress whose support was based on personal experiences with disabilities also involved traditional disabilities, including deafness, cancer, paralysis, and epilepsy. In other words, entirely missing from the public debate was a discussion regarding the need for a broader definition of disability, one for which public support appeared to be missing and a public justification lacking.

In addition to the experiences under Title VII and the Rehab Act, the nascent Fair Housing Act (FHA) amendments also should have given pause to the hope of an expansive judicial interpretation, although in fairness the statute was far too new to provide much guidance on the ADA. Nevertheless, the experience under the FHA is instructive because it has paralleled that of the ADA. Early in the life of the FHA amendments many claims arose that sought to stretch the definition of disability to include chemical sensitivity to fertilizer; to avoid no pet policies in apartment complexes, some plaintiffs argued that their pets were support animals necessary to combat symptoms of depression. It is unlikely that all of these claims were frivolous, but almost all of the claims were unsuccessful.

Before discussing the Supreme Court cases interpreting the ADA, I want to highlight one other problem that was lurking in the background.

---

that should have provided additional caution to those seeking an expansive
definition of disability. A broad interpretation posed particular problems
for employers, not just in the immediate costs of accommodation, but in
providing opportunities for workers to raise excuses for their workplace
behavior. There are very few things that anger employers more than lazy
workers or workers seeking to gain an unearned advantage in the
workplace, and courts interested in protecting the interests of employers,
as many are, would likely interpret the statute to ensure that it did not
become a font for worker grievances. Indeed, to the extent the ADA was
perceived as providing statutory protections to lazy workers, malingers,
and whiners -- those who have a difficult time coping with the everyday
stresses of the workplace -- it was a virtual certainty that courts would cut
back on the statute to eliminate those protections. In fact, that is what
happened. To date, the largest volume of ADA claims have been brought
by individuals with bad backs, which is largely an extension of an issue
that has long plagued social security and workers’ compensation systems
where back injuries have generated a tremendous amount of litigation and
controversy for decades.77 As noted earlier, efforts to expand the FHA
amendments to cover various conditions not typically thought of as
disabilities, such as chemical sensitivity, have been met with strong
resistance, and similar issues have arisen in the educational context,
particularly as it relates to learning disabilities where the rise in the
number of diagnosed disabilities has produced a sharp public reaction.78
In a similar context, there have been widely publicized attacks on the work
of Sigmund Freud and the efficacy of psychotherapy more generally,79 as

77 On its website, the EEOC reports that injuries to the back accounted for 11.4% of
ADA claims filed with the agency between 1992-2005. Only two other categories
involving non-specific conditions, that denominated “Other” and “Regarded As,” had
higher percentages. The statistics can be found at www.eeoc.gov/stats/ada.html. On
back injuries in other contexts see David Mechanic & Ronald J. Angel, Some Factors
Associated with the Report and Evaluation of Back Pain, 28 J. OF HEALTH & SOCIAL
BEHAVIOR 131 (1987) (discussing prevalence of back pain in disability and workers’
compensation claims).

78 John Silber mounted a public attack on the concept of learning disabilities one that
was ultimately rejected in the district court. See Guckenberger v. Boston University, 974
ADA). While John Silber is a controversial figure, many mainstream and thoughtful
academics have also questioned the rise of learning disabilities. See, e.g., Mark
Kelman & Gillian Lester, Jumping the Queue: An Inquiry into the Legal
Treatment of Students with Learning Disabilities (1997). For an overview of the
issues relating to learning disabilities and accommodation see John D. Ranseen &
Gregory S. Parks, Test Accommodations for Postsecondary Students: The Quandary
Resulting from the ADA’s Disability Definition, 11 PSYCH. PUB. POL. & LAW 83 (2005).

79 Frederick Crews mounted strong attacks on Freud in the left-leaning New York
Review of Books that received widespread attention. See Frederick Crews, The
Memory Wars: Freud’s Legacy in Dispute (1995). An earlier critique by Jeffrey
Masson became something of a best seller. See Jeffrey Moussaieff Masson, Assault
On Truth: Freud’s Suppression of the Seduction Theory (1984), and later Final
Interpreting the ADA

well as repressed memory syndrome,\textsuperscript{80} Ritalin and ADHD,\textsuperscript{81} all of which suggest that society has not embraced the broad definition of disability pushed by advocates, a definition that could encompass somewhere between one-quarter and one-half of all Americans. Absent either inexplicably clear statutory language or broad public support, it was surely a mistake to think these non-traditional disability issues might be favorably received in the courts. And, true to form, they have not been.

Some of the very first claims to arise under the ADA came from law students seeking additional time on the bar examination because they had bad memories, claims that generally failed.\textsuperscript{82} My nonscientific review of the literature suggests that the most frequently requested workplace accommodation is a right to work at home, or in the alternative, a right to set one’s own hours, or to come in late.\textsuperscript{83} Not surprisingly, these claims have uniformly failed and one reason is that they are precisely the kind of claims that the business community becomes most exercised about because, to them, these claims exude laziness or malingering.\textsuperscript{84} These claims also reflect the way in which the disability statute can be abused by

\textsuperscript{80}See Elizabeth Loftus, The Myth of Repressed Memory: False Memories and Allegations of Sexual Abuse (1996).

\textsuperscript{81}See, e.g., Bill Scanlon, Scamming for Ritalin: College Students Fake Attention-Deficit Disorder, ROCKY MTN. NEWS, Mar. 8, 1998, at 54A (discussing students seeking Ritalin for its buzz effect); John Merrow, Reading, Writing, and Ritalin, N.Y. TIMES, Oct. 21, 1995, at 21 (“Ritalin is so plentiful that in some junior high schools it’s a ‘gateway drug,’ the first drug a child experiments with.”); Rebecca Paul, Atlanta Leads South in Ritalin Prescriptions: Critics Say Many Kids Don’t Need the Drug, ATL. J. & CONST., Nov. 8, 1992, at A1 (lead story on “Ritalin controversy”).

\textsuperscript{83}See, e.g., Moore v. Payless Shoe Source, Inc., 139 F.3d 1210, 1213 (8th Cir. 1998) (“An employee who is unable to come to work on a regular basis [is] unable to satisfy any of the functions of the job in question . . . .”); Carr v. Reno, 23 F.3d 525, 530 (D.C. Cir. 1994) (coming to work regularly is an essential function of the job); Halperin v. Abacus Tech. Corp., 128 F.3d 191, 198 (4th Cir. 1997) (regular attendance at job required); Rauen v. United States Tobacco Mfg., 319 F.3d 891 (7th Cir. 2003) (request to work at home found unreasonable as accommodation); Mason v. Avaya Communications, Inc., 357 F.3d 1114 (10th Cir. 2004) (denying right to work at home to individual suffering from post-traumatic stress syndrome).

\textsuperscript{84}For representative cases see Tyndall v. National Educ. Centers, 31 F.3d 209, 213 (4th Cir. 19940 (“a regular and reliable level of attendance is a necessary element of most jobs . . . .”); Rauen v. United States Tobacco Mfg., 319 F.3d 891, 896 (7th Cir. 2003) (“The reason working at home is rarely a reasonable accommodation is because most jobs require the kind of teamwork, personal interaction, and supervision that simply cannot be had in a home office situation.”). Extrapolating to the Supreme Court, the same reception was almost assured. After all, Justice Rehnquist died in office, Justices O’Connor and Ginsburg worked through serious illnesses, and Justice Stevens is still working at age 86.
individuals who have no other outlet for their workplace complaints, often as a result of the formidable employment-at-will rule which sharply limits the common law rights of workers. Because of this limitation, workers often search for any statutory grounds to state a claim and the malleable nature of the disability definition has led many employees – likely prompted by attorneys – to try to fit their claims under the ADA. Even though many individuals who brought such claims may have had legitimate health conditions that should have fallen within the literal scope of the ADA, there was little question that the claims would be received hostilely. But this is quite different from a backlash, or if it is a backlash it is one that is not unique to the courts as the effort to expand the definition of disability to reach nontraditional disabilities has failed to gain broad societal acceptance.

This confluence of factors rendered the prospects of an expansive, or literal, interpretation of disability remote at best. Instead what should have been expected was a substantial judicial rewriting of the statute, one that was likely to mirror existing social norms, where there is generally broad support for protecting those with serious disabilities – even though there remain substantial concerns regarding the potential costs of accommodation – and little support for extending the statute to those who appear undeserving of protection.

III. THE CASES: A BACKLASH?

The social backdrop presented above leads to a discussion of the Supreme Court cases typically defined as the heart of the judicial backlash. In this section I will explore the cases, with a particular focus on Sutton v. United Airlines, and seek to explain the rationality of the decisions, or alternatively, why the decisions were highly predictable given the statutory directive and governing social norms.

A. Sutton v. United Airlines: Restricting the Scope of the Statute.

The case of Sutton v. United Airlines involved twin sisters who worked as commuter airline pilots and sought to move up the professional ranks to fly commercial planes for United Airlines.\(^{85}\) The Sutton sisters suffered from severe myopia and were unable to satisfy the airline’s qualification standard of having uncorrected vision of 20/100.\(^{86}\) When

\(^{86}\) Because the Supreme Court decided that the Suttons did not qualify as disabled under the statute, the airline never had to justify its rule. Presumably the rule was based on safety concerns, particularly in the event of turbulence or some other disruption during which the pilot might lose her glasses. Kenji Yoshino has suggested that, as an accommodation, the Suttons could have been allowed to bring an extra pair of glasses on the plane. Kenji Yoshino, Covering: The Hidden Assault on Our Civil Rights 175 (2006). Having an extra pair of glasses may have helped in the event one pair broke (or
Interpreting the ADA

United rejected them based on their eyesight, the sisters sued arguing that their condition rendered them disabled under the statute and required the airline to provide a reasonable accommodation, presumably allowing them to wear corrective lenses while flying. Alternatively, they argued that if they were not disabled under the terms of the statute, the employer was regarding them as disabled because United was treating them as if their eyesight was a substantial limitation.87

With those facts in mind, it is difficult to conceive of a worse test case than the Suttons presented and the only real surprise was how close the case ended up – and it was close only because the dissenters understood just how much was at stake.88 Nevertheless, the Sutton case is generally identified as the critical backbone of the judicial backlash,89 so a detailed analysis of the case will help demonstrate why it is a misnomer to label the interpretive developments as a backlash against the disabled. Rather, the Sutton case is best understood as the product of a poorly worded statute that too easily opened itself to opportunistic plaintiffs who were never intended to be its beneficiary.90

contact lenses came out) but would not help in the more likely circumstance of turbulence or other disruption.

87 The “regarded as” issue will be discussed further below, but I also want to highlight a potential problem with the argument that rendered it ill-fitting for this case. Under the original vision of the statute, a plaintiff who is regarded as disabled should not need an accommodation because they are not disabled. The Suttons, however, would have needed an accommodation: they could not see sufficiently without their glasses, and so they would need to be allowed to wear them. Courts have split over the question whether an accommodation is required for those who are regarded as disabled. See D'Angelo v. ConAgra Foods, 422 F.3d 1220 (11th Cir. 2005) (holding that employer must offer accommodations to regarded as disabled individuals and discussing circuit split)

88 Justice Stevens and Breyer dissented

The primary doctrinal question presented in Sutton was whether determining if an individual is disabled should consider available mitigating measures or whether that preliminary inquiry should assess the plaintiff in his or her unmitigated state. Within disability law, this is an enormous question because many potentially disabling conditions can be mitigated through various corrective measures such as hearing aids, prosthetic devices and perhaps most commonly, medication. Taking into account mitigating measures might exclude from the statute’s protective scope individuals who formed the core group Congress intended to protect, including individuals with epilepsy, such as the original House Sponsor Tony Coehlo, since epilepsy can generally be controlled by medication. Ignoring mitigating measures, on the other hand, would allow many individuals who would not be considered disabled in any ordinary sense of the word into federal court, and to the Supreme Court, this group included those who wear glasses. In the briefs, and at the oral argument, it was repeatedly emphasized that as many as 100 million Americans used corrective lenses and the Supreme Court was exceedingly unlikely to open the door to all, or even some, of those individuals.

As a result, this was the very kind of case that could have been anticipated by the legislative drafters but, if left unaddressed in the statute, would likely lead to a narrowing of the statute’s scope. This was true not only because the potential class was enormous, but as such unsympathetic plaintiffs the Suttons played on all of the Supreme Court’s fears regarding the potential direction of the statute. For example, this case could be identified as falling within the special rights category insofar as the plaintiffs could be perceived as undeserving plaintiffs seeking an unfair advantage in the workplace. The Suttons already had very good jobs, and their glasses posed a real safety issue to passengers. On this score, even if the Suttons had been defined as disabled, they ultimately would have lost their claim as a safety matter, given that the statute permits work rules necessary to ensure safety under several different statutory approaches.

---

91 See SHAPIRO, supra note 26, at 117.

92 Sutton, 527 U.S. at 487 (“[T]he number of people with vision impairments alone is 100 million.”).

93 While the Suttons were not demonstrably less qualified than other candidates given that the vision requirement was a safety issue rather than one that went to their ability to fly a plane, it was easy to see this case as involving individuals seeking to take advantage of a statute that was not designed for their benefit. But see Pamela S. Karlan & George Rutherglen, Disabilities, Discrimination, & Reas. Accom., 46 DUKE L.J. 1, 14 (1996) (equating duty to accommodate with affirmative action).

94 See note 69 supra. The only mitigating factor was that United had the most stringent requirement in the industry.

95 This point was emphasized by Justice Stevens in his dissenting opinion. ld. at 511 (Stevens, J. dissenting). One might have argued that the airlines should be required to
The most important failing of their claims, however, was that their condition had nothing to do with the underlying concept of discrimination: there is no basis for claiming that those who wear glasses are the victims of discrimination (schoolyard taunts aside) that federal law ought to concern itself with. Nor was there any sense that with their glasses on, the Suttons were limited in their ability to see. Rather, with their glasses on, they were like anyone else who regularly wears glasses and their daily life was not generally affected in any substantial way. It is difficult to conceive of any reason a Court ought to want to protect these individuals, and the reasonable fear that there were many more individuals like the Suttons waiting in the wings made their claim even more precarious.

In their defense, the Suttons had extremely poor eye-sight and the Court certainly could have drawn a line designed to exclude from the statute’s scope only those with less severe limitations. But the Court needed a reason to draw that line, and it never found one. At the oral argument, this issue was addressed explicitly by one of the Justices. Even though the Suttons may have been more limited in their ability to see than most people, the Justice noted, once they put on their glasses they were effectively the same. Why then should the severity of the underlying condition matter when the mitigating measures equalize them? The answer proffered by the Suttons’ attorney was wholly unpersuasive. He claimed that the statute told the Court to make that distinction, an argument that was incorrect on two different levels. The statute said nothing about whether mitigating measures should be considered in the disability calculus; that issue was addressed specifically in the Committee Reports, a place a majority of the Court was reluctant to look. More to prove the danger but that would obviously be a significantly more expensive proposition if all such work rules had to be justified. Moreover, this seems like precisely the kind of claim where intuitive analyses are likely to prevail: while there may have been only a small risk of harm, the potential danger is tremendous, the very kind of situation that is most likely to be magnified.

Sutton was decided at a time when the Justices were not identified by name in the oral argument transcripts.

A substantial portion of the oral argument was devoted to the question whether such a line was possible, and desirable. The Oral Argument transcript is available at 1999 WL 281310.

Although by the time of Sutton, a majority of the Supreme Court had become hostile to legislative history, the movement away from reliance on legislative history was clearly present at the time the ADA was adopted. Both Judge Easterbrook and Justice Scalia had long and forcefully challenged the relevance of legislative history. See, e.g., Pierce v. Underwood, 487 U.S. 552 (1988)(Scalia, J.) (writing for the Court and rejecting committee reports); United States v. Taylor, 487 U.S. 326, 345 (1988)(Scalia, J. concurring) (“[I]t must be assumed that what members of [Congress] thought they were voting for, and what the President thought he was approving when he signed the bill, was what the text plainly said, rather than what a few Representatives or even a Committee Report, said it said.”). Judge Easterbrook laid out his theory in a series of highly influential articles. See Frank Easterbrook, The Rule of Original Intent in Statutory Construction, 11 HARV. J. L. & PUB. POL’Y 59 (1988); Frank Easterbrook, The Supreme
Interpreting the ADA

the point, neither the statute nor the legislative history suggested that the severity of the unmitigated condition should be a relevant factor – from the legislative materials, the question was whether mitigating factors should be considered not whether they should sometimes be considered. A decision to focus on the severity of the underlying condition could only arise from a pragmatic determination to limit the breadth of the disability class while preserving what might be considered core claims. Yet, the Suttons were not within the core group, and part of their argument, a part that went unarticulated, was that the Court should provide them statutory coverage as a way of preserving coverage for other deserving plaintiffs – those who use prosthetic devices, suffer from epilepsy or other substantial conditions that can be treated with medication. This is understandably a difficult argument for a party to make and there were good reasons why the argument went undeveloped.

Importantly, the Court sought to limit the potential damage of its ruling by noting that even those who have access to mitigating measures may still qualify as disabled so long as they remain limited in a major life activity.99 This part of the Court’s decision has mitigated some of the fears of the backlash critics, and plaintiffs with serious disabilities, for example, those who might use prosthetic devices or those with severe depression, have generally qualified as disabled even after Sutton.100 In this way, the Court drew a line that sought to preserve core claims while excluding those the Court considered beyond the proper scope of the statute. By proper, I do not mean that which was consistent with congressional intent. As alluded to above, the legislative history was reasonably clear that an individual should be considered in their unmitigated state.101 By proper, I mean what the Court considered the appropriate scope of the disability statute, independent of Congress’s actual intent.

There remains the complicated issue of the “regarded as” prong of the statute, which is where much of the criticism of the case has focused.102 The Suttons argued that if they were not disabled under the

---

99 Sutton, 527 U.S. at 488 ("The use of a corrective device does not, by itself, relieve one’s disability. Rather, one has a disability under subsection A if, notwithstanding the use of a corrective device, that individual is substantially limited in a major life activity.").

100 See cases cited in footnote 16, supra.

101 See, e.g., H. Rep. No. 101-485, pt.2, at 50 (1990) ("Whether a person has a disability should be assessed without regard to the availability of mitigating measures, such as reasonable accommodations or auxiliary aids."); S. Rep. No. 101-116, at 23 (1989) ("[W]hether a person has a disability should be assessed without regard to the availability of mitigating measures, such as reasonable accommodations or auxiliary aids.").

102 See, e.g., Miranda Oshige McGowan, Reconsidering the Americans With Disabilities Act, 35 GA. L. REV. 27, 122-27 (2000) (critiquing Sutton’s interpretation of regarded as while supporting the Court’s holding on mitigating measures); Wendy
Interpreting the ADA

statute, then by considering their eyesight as a substantial limiting condition United Airlines was certainly treating them as if they were. Why else, one might ask, was United Airlines restricting their job opportunities? This argument proved too clever by half, as the saying goes, though it certainly had some support in the statutory language. However, as a practical matter, this issue was destined to fail. If the Supreme Court had allowed a “regarded as” claim in this particular case, all of the benefits of its initial holding on the mitigating conditions would have been lost because once it was determined that the plaintiff was not disabled, she would then turn to a “regarded as” claim. This is, in fact, what happened in a large number of early disability claims where plaintiffs frequently tagged on a regarded as claim as a safety valve. Yet, just as the Court’s holding on the glasses issue was inevitable, so too was its interpretation of the regarded as prong, where the Court crafted the virtually impossible standard that an employee is regarded as disabled only to the extent that the employer regards her as unqualified from a broad class of jobs.

Although the Court’s decision has sharply limited the force of the regarded as prong, as a matter of discrimination, the Court’s rationale was not so extreme. One of the problems with the regarded as language is that it has always been difficult to know what protection the provision was intended to provide. The regarded as prong probably could only work in the context of what courts would consider the most deserving of plaintiffs – those who are disabled but who do not need accommodations. Let me

---

103 Prior to the Court’s determination in Sutton, it was quite common for an individual who was found not to qualify as disabled to turn to a “regarded as” claim, although most of those claims failed. See, e.g., Talk v. Delta Airlines, Inc., 165 F.3d 1021 (5th Cir. 1999) (plaintiff sought to establish regarded as claim after failing to prove he had a substantial limitation); Wooten v. Farmland Foods, 58 F.3d 382 (8th Cir. 1995) (employee on light duty was neither disabled nor regarded as such); Newberry v. East Texas State Univ., 161 F.3d 276 (5th Cir. 1998)(plaintiff sought to prove his employer regarded him as disabled after failing to establish that his behavior qualified as disabled); Robinson v. Global Marine Drilling Co., 101 F.3d 35 (5th Cir. 1996) (plaintiff’s asbestosis was not a substantial limitation and employer did not regard individual as disabled because he had asbestosis). Courts frequently treat the regarded as claim summarily and in unpublished opinions. See Gibbs v. St. Anthony Hosp., 1997 U.S. App. LEXIS 2362 (10th Cir. 1997) (plaintiff sought to establish employer regarded him as disabled when he failed to establish his lifting restrictions constituted a disability). See also Issacharoff & Nelson, supra note 22, at 328 (discussing potentially circular nature of regarded as claim).

104 Sutton, 527 U.S. at 493.

105 As noted previously, there is currently a debate occurring in the lower courts concerning whether employers must offer accommodations to individuals who are regarded as disabled. See D’Angelo v. ConAgra Foods, 422 F.3d 1220 (11th Cir. 2005).
offer an example from my own experience. Shortly after the ADA was passed, I noticed an airline ticket agent who had one arm. From what I could tell, he typed just as fast as someone with two arms, but prior to the ADA the airline likely would never have given him the opportunity to perform the job because of its perception that two arms were required for effective typing. In most instances, individuals with conditions such as this who are treated adversely by their employers ought to succeed under the basic definition of disability and therefore would not need to avail themselves of the regarded as prong but that may not always be the case. More to the point, this is precisely the kind of condition or situation that the ADA was intended to address – the employer’s misperception of the ability of an individual with a disability. While many different interests and motives lay behind the statute, a central goal was to overcome those misperceptions, the lack of understanding of the abilities of those with disabilities, and perhaps that is the best way to conceive of the regarded as prong. In contrast, one would have to look far and deep to find any collective sense that the ADA was intended to help those who wear glasses overcome the stigma and travails that comes along with the glasses, and I think the same can be said of those with high blood pressure, chemical sensitivity, and the like. In the end, this may be a limited concept of what the regarded as prong was intended to encompass, but it seems likely the best judicial interpretation one could hope for absent a more pointed and specific statutory directive.

In discussing the inevitability of the Supreme Court’s decision in *Sutton*, it is equally important to emphasize how the Court reached its conclusion that mitigating measures were to be considered: the Supreme Court ignored statutory language, legislative history, and an EEOC regulatory interpretation while focusing instead on language from the statutory preface, which it never adequately dealt with. In its opinion, the Court emphasized the statute’s prefatory language which states that 43...
Interpreting the ADA

million individuals were disabled, concluding that not requiring mitigating measures would greatly expand the statute’s coverage beyond 43 million. Yet, under the Supreme Court’s interpretation, the number of individuals covered by the statute now certainly falls well below 43 million since from the legislative history it was clear that Congress intended to include in that original number at least some individuals who can mitigate their disabling condition. Without some explanation, it is difficult to see how an interpretation that restricts the intended scope of the statute should have any priority over one that expands that scope.

When statutory language is ambiguous, as it decidedly is in the definition of disability, without guidance from some alternative source, the Court will be left with its own normative vision of how the statute ought to be interpreted, and that is what it appears the Court accomplished in Sutton and the other cases discussed below. In the case of the disabilities Act, the Court has frequently accomplished its statutory objective by rejecting administrative interpretations. Relevant to the Sutton case, the EEOC and the Justice Department had both promulgated regulations directing that the determination of whether an individual is disabled should exclude mitigating measures. From this perspective, Sutton is surely a paradigmatic example of the Court’s selective use of statutory construction tools. Indeed, in Sutton, one can plausibly claim that the Court focused on irrelevant language at the expense of more clear language and clear legislative history, and disregarded agency interpretations along the way in order to read the statute consistent with its own normative vision. Although this is hardly an example of neutral reasoning, it was highly predictable nevertheless.

B. Exposing the Limits of the Backlash Thesis.

1. Williams v. Toyota Mfg. Another case that has come in for considerable scholarly criticism, Williams v. Toyota Motor Mfg., was decided shortly after Sutton and fits within the framework described above of a fully predictable judicial result, and one that again has narrowed the scope of the statute. Unlike the Sutton case which presented a terrible

109 Id. at 484.
110 In his dissent, Justice Stevens criticized this aspect of the majority’s opinion. See Sutton, 527 U.S. at 498 (Stevens, J., dissenting).
111 See note 107 supra.
112 Jim Brudney and Corey Ditsler make a similar argument with considerable focus on the Sutton decision. The authors conclude their study by noting: “[T]he Court’s reliance on canon-based reasoning can seem plausible and ‘objective’ under one set of conditions, unpredictable and inconsistent in a second setting, and strategically or ideologically driven in a third. . . .” James J. Brudney & Corey Ditslar, Canons of Construction and the Elusive Quest for Neutral Reasoning, 58 VAND. L. REV. 1, 112 (2005).
test case, the carpal tunnel syndrome at issue in *Williams* was bound to make its way to the Supreme Court and was an issue that had to be resolved. Ella Williams worked on the assembly line at a Toyota plant, and like many individuals working in similar positions, she suffered injuries to her hands, arm, and wrist from the repetitive motion of the line. Toyota’s own doctor diagnosed Williams with carpal tunnel syndrome and placed her on permanent work restrictions.\(^{114}\) For the next two years, Williams worked on modified light duty but still missed some work, and she ultimately filed a workers’ compensation claim that the parties settled. Williams was then assigned to a quality control line where she worked without problem for another two years until she was required to rotate through all of the various job tasks, which included certain manual tasks she could not perform without significant pain. At this point, she was again placed on work restrictions and the employer later terminated her purportedly for her poor attendance.\(^{115}\)

The *Williams* case fell at the ill-defined intersection of three different statutes: workers’ compensation, long-term disability under social security and the ADA. From an institutional standpoint, the idea that carpal tunnel syndrome is generally not covered by the ADA fits the Supreme Court’s interests in two distinct ways. First, carpal tunnel syndrome is typically a work-related injury, and would generally be covered under the more limited workers’ compensation system, which provides a no-fault scheme for injuries suffered in the course of employment and does so by providing limited statutory remedies for the injuries in state administrative forums.\(^{116}\) Just as the Court was hesitant to open the door to nontraditional disabilities in *Sutton*, the Court was also understandably reluctant to turn the ADA into an alternative forum for workers’ compensation claims, not just because it would prefer to keep the cases out of federal courts but also because allowing such claims would eviscerate the exclusivity of workers compensation.\(^{117}\)

---

\(^{114}\) *Id.* at 187.

\(^{115}\) *Id.* at 188-89.

\(^{117}\) Now Chief Justice Roberts emphasized this point towards the end of the brief he filed on behalf of Toyota Motors. *See* Brief of Petitioner, at 18 (noting that the lower court’s decision “upsets the statute’s interaction with workers’ compensation laws.”). At oral argument, the second question that came from the Court involved the relationship between workers’ compensation and the ADA, and the issue reappeared throughout the argument. As a general matter, when an employee is injured on the job, she is able to obtain prompt relief from the workers’ compensation scheme. While certainly not without its problems, that scheme represents a deliberate and careful compromise in that
The second factor counseling against ADA coverage of carpal tunnel syndrome relates back to what I earlier discussed as the concerns of business. Carpal tunnel syndrome is among those ergonomic injuries that the business community fought so strongly against for years, including by blocking the development of an ergonomics standard in the Department of Labor.\(^{118}\) Those efforts were led by Eugene Scalia, one of the many sons of Justice Scalia, who cut his teeth as a labor lawyer by becoming one of the most prominent critics of the presence of ergonomic injuries – a task that earned him the brief reward of Labor Department solicitor.\(^{119}\) Given the controversy surrounding ergonomics injuries, it seems likely that at least some members of the Court would greet the issue of carpal tunnel syndrome with skepticism, while others would have seen the case as potentially transforming the ADA into an alternative form of workers’ compensation, something the Court was clearly unwilling to do. In the context of the judicial backlash story, it is worth emphasizing that the Supreme Court decision in Williams was unanimous.

Most of the criticism of the Williams decision ignores the workers’ compensation aspect of the case to focus on the Court’s restrictive interpretation of the statute, which now requires individuals to establish that they are limited in performing tasks that are of “central importance to most people’s lives.”\(^{120}\) This restriction has forced courts into awkward inquiries concerning whether individuals are capable of brushing their teeth or hugging their spouses in order to determine whether they are disabled.\(^{121}\) While this inquiry has led to excluding some individuals who the employee does not have to prove the employer was at fault, and in return the remedies are quite limited. The remedy is also exclusive; in other words, it is generally easy for an employee who is injured on the job to get into the system but it is intentionally very difficult to get out of the established compensation scheme.

\(^{118}\) See MARION CRAIN, PAULINE KIM & MICHAEL SELMI, WORK LAW 926-27 (2005) (discussing battle over ergonomics standards).

\(^{119}\) See Christopher Marquis, Bush Bypasses Senate on 2 More Nominees, N.Y. TIMES, Jan. 12, 2002, at A1 (noting that Eugene Scalia who had previously denounced ergonomics as “quackery” had received a recess appointment). Since I emphasized the workers’ compensation aspects of the case that were included in the briefs and arguments, I should note that at the oral argument, there was no discussion relating to the nature of carpal tunnel syndrome, although the issue was raised specifically in the amicus brief filed on behalf of the petitioner by Levi Strauss.

\(^{120}\) See, e.g., Nuzum v. Ozark Auto Distrib., 432 F.3d 839, 846 (8th Cir. 2005) (considering but not deciding whether hugging was a major life activity); Guzman-Rosario v. UPS, 397 F.3d 6 (1st Cir. 2005) (plaintiff’s ovarian cysts did not interfere with sitting down or doing housework); Heiko v. Colombo Savings Bank, 434 F.3d 249 (4th Cir. 2006) (elimination of waste was a major life function); Rooney v. Koch Air, Inc., 410 F.3d 376 (7th Cir. 2005) (individual was not disabled because able to crawl and bend); McGeshick v. Principi, 357 F.3d 1146 (10th Cir. 2004) (working in stairwells and cleaning ledges was not a major life activity). A substantial number of cases, with
were likely intended to be covered by the ADA, the case is a natural extension of the concerns addressed in *Sutton*. The Court’s decision in *Sutton* was necessary to keep anyone with a medical condition the employer sought to consider from raising a “regarded as” claim; it was necessary in *Williams* to restrict the definition of major life activity so as to close the workers’ compensation door. Reminiscent of its decision in *Sutton*, reaching its conclusion in *Williams*, required the Court to disregard an EEOC guidance and more logical textual analysis as the price of ensuring there was “a demanding standard for qualifying as disabled.”  

Despite the Court’s circuitous path, there is little question that its decision was ultimately consistent with the purpose of the ADA, which no one could plausibly contend was intended to supplant workers’ compensation or to allow those with work-related injuries to seek accommodations in addition to the remedies available under workers’ compensation.

2. *Chevron v. Echazabal*. Two other cases deserve mention within the framework of this article. In *Chevron v. Echazabal*, the question was whether the statutory language that permitted employers to restrict actions when an employee posed a danger to others could be stretched to include danger to oneself.  

The case posed an unusual situation because Echazabal had a serious illness (Hepatitis C) and Chevron contended that allowing him to continue working would pose a risk to his life. Most individuals in these circumstances would not want to continue working, and it seems, on the merits alone, the Supreme Court would likely side with the employer who was engaging in paternalistic rather than obviously discriminatory actions. Yet, of the cases discussed in this paper, *Echazabal* presented the most difficult path for the Court to reach its desired result, namely that employers could exclude individuals who posed a danger to their own health.

The Court’s path was tortured because the language of the statutory affirmative defense at issue in the case did not say anything about posing a risk to oneself, specifically mentioning only “a direct threat to the health or safety of other individuals in the workplace.”  

An EEOC regulation supported Chevron’s interpretation, but having just ignored EEOC regulations in *Sutton* and *Williams*, one might have thought the Court would be constrained to again disregard the regulation, particularlyconflicting results, have involved interpersonal skills raising the question whether getting along with others or belonging is a major life activity. For an analysis of these cases and advocating a broad approach see Ann Hubbard, *The Major Life Activity of Belonging*, 39 Wake Forest L. Rev. 217 (2004).

---

122 *Sutton*, at 197.

123 This latter point is perhaps more controversial. One might arguably maintain that the accommodation provision of the ADA should enable one otherwise unable to work due to a workplace injury to return to employment in some more limited capacity.

125 42 U.S.C. § 12113(b).
Interpreting the ADA

given that the statutory language was unequivocal. In other words, if the Court were true to the statutory language, and to its prior interpretive methodology, it should have ruled in favor of Echazabal by holding that the EEOC regulation was in conflict with the statutory language. A second, and in some ways even more problematic, hurdle was the parallel to the Court’s earlier decision in Johnson Controls, where the Supreme Court had invalidated an employer’s practice of excluding women from a battery making facility as a way to protect their fetuses from lead exposure. A central premise of Johnson Controls was that women should be able to choose for themselves how to protect their bodies and potential fetuses, and in many ways it seemed an easier determination that employees should be able to decide whether they wanted to continue working knowing the risks the work presented to their own health. As a matter of expressed judicial policy, and clear statutory language, Echazabal should have prevailed but that was not to be.

In its unanimous decision, the Supreme Court dismissed the parallel to Johnson Controls in a footnote, and also had little trouble finding that the employer’s actions were permissible. Equally clear, the Court’s decision evinced a paternalistic attitude, an attitude that has long prevailed when it comes to the disabled and one that demonstrates that, certainly to the Court, disability discrimination is different from discrimination based on gender or race, or the other traditional categories. This latter point ties into the lack of a social movement on disability, as it suggests that we have failed to move the debate forward regarding the treatment of those with disabilities, and instead remain locked in what should be an outdated viewpoint. In the Echazabal case, not even clear statutory language made a difference -- the Supreme Court instead chose to follow the EEOC interpretive guideline after having rejected similar guidelines in Sutton and Williams.

3. Bragdon v. Abbott. This leads to the final case I want to highlight to show how the Supreme Court has interpreted the ADA consistent with broad social norms. Bragdon v. Abbott has been one of the few notable successes in the Supreme Court, a case in which the Court found that an asymptomatic HIV-positive individual was covered by the

127 The case is analyzed by Professor Sam Bagenstos, who was counsel to Echazabal in the Supreme Court, in Samuel R. Bagenstos, The Supreme Court, the Americans With Disabilities Act, and Rational Discrimination, 55 ALABAMA L. REV. 923 (2004).
128 Echazabal, 536 U.S. at n.5.
129 The one case that does not necessarily fit within this schema is Cleveland v. Policy Mgt. Systems Corp., 526 U.S. 795 (1999), where the Court held that it was possible that an individual could be disabled for the purposes of obtaining Social Security Disability Insurance and therefore unable to “engage in gainful work” while simultaneously pursuing a claim under the ADA. What was perhaps most surprising about this decision is that it was unanimous, as was true for Echazabal and Toyota Motor Manuf.
Interpreting the ADA

statute because she was limited in the major life activity of procreation.\textsuperscript{130} Although on the surface it may seem obvious that someone who is HIV-positive should be treated as disabled, it was not such an easy conclusion given that the statute requires the individual be limited in a major life activity and one definition of being asymptomatic is that an individual is not so limited. As a way of bringing the claim within the statute, the court defined reproduction as a “major life activity,” and did so based on agency interpretations, experience under the Rehab Act, and an opinion by the Office of Legal Counsel.\textsuperscript{131} Although the Court’s decision is intuitively appealing, it creates some curious theoretical difficulties in cases involving menopausal women or others who are not capable of reproducing.\textsuperscript{132} At the same time, the Court’s decision seems entirely consistent with Congressional intent and broader social norms, which almost certainly would find those who were HIV-positive as among the group that ought to be protected by the disability laws.\textsuperscript{133}

IV. UNDERSTANDING THE EVOLUTION OF THE ADA.

To this point, I have been telling a story that serves primarily as a counter story to the prevailing theme of judicial backlash. As just discussed, there is little question that the Supreme Court has narrowed the scope of the statute, and I have suggested it has done so to bring the statute in line with broad social norms regarding what ought to be defined as a disability. The Court has accomplished this feat without substantial regard for legislative intent, or a principled approach to statutory interpretation but in doing so appears to have drafted a statute Congress prefers as evident by its failure to override the judicial interpretations, or more specifically by the lack of any effort to override those interpretations. In this section, I want to explore what additional lessons the case study might present regarding statutory interpretation, and the limits of seeking social change through litigation. Although one must always be cautious about drawing broad conclusions from a single case study, the evolution of the ADA provides keen insights into the Court’s methodologies and how it can impose its own preferences – preferences that will often follow, rather than transform those social norms.

\textsuperscript{131} Id. at 638-46.
\textsuperscript{132} Mark Kelman has noted the potential absurdity of the Court’s interpretation, which might mean that a menopausal woman would not be covered by the statute and the Court’s analysis required it to ignore the fact that the dentist would have refused to treat someone who had full-blown AIDS. See Mark Kelman, DOES DISABILITY STATUS MATTER?, IN AMERICANS WITH DISABILITIES: EXPLORING IMPLICATIONS OF THE LAW FOR INDIVIDUALS AND INSTITUTIONS 91 (L. Pickering Francis & A. Silvers eds. 2000).
\textsuperscript{133} It also followed from the Supreme Court’s earlier decision in School Board of Nassau County v. Arline, 480 U.S. 273 (1987).
A. Can the Court’s Approach Be Reconciled With Theories of Statutory Interpretation?

1. Normative Theories of Interpretation. The ADA poses a particularly difficult challenge for the reigning theories of statutory interpretation. Within contemporary legal debates, the various theories of interpretation can be roughly divided into two camps, the textualists who emphasize the statutory text and eschew dependence on legislative history, and the intentionalists who prefer methods of interpretation designed to divine the intent of Congress and are far more willing to probe into legislative materials beyond the statutory text. The last decade has seen a lively debate arise over the merits of the two approaches, but in the context of the ADA, neither approach provides a satisfactory means of interpreting the statute, leaving courts to their own normative framework to define the scope of the statute.

The goal of textualists is to arrive at an objective intent embodied in the words of the statute as reasonably understood by an observer given the context of the statute’s passage. As should be evident from the statutory language discussed earlier, an interpretation based on the reasonable understanding of the text is likely to run aground quickly – no one would think to define disability as a “substantial limitation on a major life activity,” and even if someone did, each word would still require interpretation. Similarly, the ambiguity present throughout the text cannot easily be resolved by any objective practices, such as a turn to a dictionary or various canons of construction. In Sutton, the Court resorted to a grammatical construction of the statute, and while its interpretation was plausible, other interpretations were equally plausible. Indeed, the Justice Department and the EEOC both read the same language differently without resorting primarily to legislative history.

Intentionalists would not fare much better. Even though the legislative history provided some answers to general questions —

---

134 The literature is expansive and most of it is centered on normative considerations. As is widely recognized, Justice Scalia and Judge Easterbrook are the best known judicial proponents of a textualist method, and their arguments have been extremely influential. Among academics, John Manning has emerged as the leading defender of textualism. A good summary of the debate and the purported differences between textualism and intentionalism can be found in Caleb Nelson, What is Textualism, 91 Va. L. Rev. 347 (2005), though Nelson argues that the two camps are not as different as their various proponents state. In this section, I will use the term intentionalism, which seems currently to be the most common contrast to textualism, whereas others might use purposivism. For an argument similar to Nelson’s but that invokes purposivism see Jonathan T. Molot, The Rise and Fall of Textualism, 106 Colum. L. Rev. 1 (2006).

135 See John F. Manning, Textualism and Legislative Intent, 91 Va. L. Rev. 419, 421 (2005) (“Textualists thus aspire ‘to read the words of [a statutory] text as any ordinary Member of Congress would have read them, and apply the meaning so determined.’”).

136 See earlier discussion re Sutton.
particularly on the mitigating measures issue—it failed to address, and ultimately left open, most of the difficult specific questions. Some earlier versions of intentionalism required courts to ask how Congress would have addressed the issues that later emerged, and it would have been very difficult to apply the general answers found in the legislative history to the specific problems that have arisen. For example, although Congress suggested that an individual ought to be assessed in his or her unmitigated state, it almost certainly did not mean to include individuals who wear glasses within that determination. More likely, had they considered the issue with more care, Congress would have concluded that mitigating measures should only be disregarded when assessing individuals with traditional, or serious, disabilities. But that is, at best, just a guess, and even if Congress had made that determination, there would still have been a question how to define a serious, or traditional, disability, thus leaving substantial discretion for judicial interpretation. A similar analysis would apply to carpal tunnel syndrome, and canvassing the legislative history provides no definitive answer to whether workplace injuries were intended to be covered or whether they ought to be left to the workers’ compensation remedial scheme.

One reason both of the common interpretive approaches fail to yield results is that both approaches assume there is some discoverable legislative intent either from the text or other legislative materials. However, with the ADA, it is a mistake to assume there was any such intent other than in a most general way. If one were to ask members of Congress what they intended when they passed the ADA, the vast majority would have been unable to say anything more than that they intended to prohibit discrimination based on disability. If they were pressed to offer an opinion on what they meant by disability, virtually none would have been able to offer a reliable answer, and instead would likely have pointed to the sponsors as offering an authoritative guide.

---

137 This approach is sometimes referred to as imaginative reconstruction and it is tied to older theories of interpretation designed to further Congressional purpose. See Richard A. Posner, *Statutory Interpretation – in the Classroom and in the Courtroom*, 50 U. Chi. L. Rev. 800, 817 (1983) (“I suggest that the task for the judge called upon to interpret a statute is best described as one of imaginative reconstruction. The judge should try to think his way as best he can into the minds of the enacting legislators and imagine how they would have wanted the statute applied to the case at bar.”).

138 This was a position staked out by the Fifth Circuit prior to the Court’s decision in *Sutton*. See Washington v. HCA Health Servs. of Texas, Inc., 152 F.3d 464 (5th Cir. 1998) (holding that only some impairments should be evaluated in their uncorrected state).

139 Textualists typically eschew any notion of a collective congressional intent, but they do believe that legislative intent can be discerned from the language and other objective practices. See John F. Manning, *Textualism and Legislative Intent*, 91 Va. L. Rev. 419424 (2005) (“Textualists . . . deny that Congress has a collective will apart from the outcomes of the complex legislative process that conditions its ability to translate raw policy impulses or intentions into finished legislation.”).
From this perspective, relying on legislative history might be most consistent with congressional intent. Dan Rodriguez and Barry Weingast have developed a theory of statutory interpretation that emphasizes the important role played by pivotal legislators in ensuring passage of legislation. They focus in particular on the critical role conservative Democrats played in ensuring the passage of the Civil Rights Act of 1964 to suggest that the views of those legislators, rather than the views of the bill’s sponsors, provide the best guide to legislative intent.

This theory is premised on a better, and more realistic, view of Congress than most theories of statutory interpretation, but it remains problematic from a variety of perspectives. Perhaps the most significant limitation surrounds defining pivotal legislators – while Rodriguez and Weingast typically look to the final legislators who sign onto legislation, relying on the interpretation of those last legislators may neglect the view of the more liberal legislators who may have declined to support legislation that only went as far as that supported by the most conservative members. In any event, turning the theory upside down, when a bill has no substantial opposition, the views of the sponsors might be the best evidence of legislative intent if for no other reason than that the other members of Congress would likely have no developed views. Yet, in the case of the ADA, focusing on the views of the bill’s sponsors would not have provided much more than a general directive, and that directive would have suggested little more than that the statute ought to be construed broadly to further the statute’s remedial goals.

Although the primary methods of statutory interpretation would fail to provide any conclusive answers, it might be argued that the Court’s decisions are consistent with interpretive theories that emphasize the role of social norms or public values. William Eskridge has, for example, highlighted the importance of public values in giving meaning to ambiguous statutory language, though he has also sounded a cautionary

141 Rodriguez & Weingast, Positive Political Theory, supra note [139], at 1428.

142 For example, President Johnson brought substantial pressure to bear on a number of critical Southern legislators. It is not always clear, however, that the support of what Rodriguez and Weingast label pivotal legislators turned on particular interpretations of the Act, as often the President offered support on other projects in return for support of the Civil Rights legislation. See Nick Kotz, Judgment Days: Lyndon Baines Johnson, Martin Luther King, Jr., and the Laws That Changed America (2005).

143 At one time, the Supreme Court adopted a similar view and often interpreted civil rights legislation consistent with its remedial purpose. See, e.g., Zipes v. TWA, 455 U.S. 385 (1982) (emphasizing the importance of the remedial purpose of Title VII in interpreting filing deadlines); Albemarle Paper Co. v. Moody, 422 U.S. 405 (1975) (defining back pay as central to the remedial purposes of Title VII).
Interpreting the ADA

note about the limits of such an approach. In Professor Eskridge’s model, it is inappropriate for courts to “use[] public values analysis to displace an apparent legislative decision that has not been overtaken by changed circumstances.” At the time he was writing, Professor Eskridge seemed to assume that incorporating public values into statutory analysis would likely broaden remedial statutes, and the cases he championed as models of public value reasoning were those in which civil rights, or other important liberal values, were ultimately upheld. The Court’s decisions on the ADA, and its statutory approach, would be difficult to reconcile with Eskridge’s theory; in fact, he specifically condemned judicial efforts to rewrite statutes while ignoring clear language or other legislative materials.

The Court’s implicit emphasis on social norms might also be seen as consistent with a textualist approach to interpretation. A central precept of the textualist method is that a court ought to define statutory terms based on common understandings. Given that the Supreme Court has largely defined disability consistent with existing social norms, it might appear that the Court’s method is, in fact, a principled textualist approach. This argument, however, neglects the specific textual words – “a substantial limitation on a major life activity” – and would allow the Supreme Court to substitute a common sense definition for the specific statutory text. This might be a reasonable approach for the Court to take but it is a difficult one to reconcile with an emphasis on the actual written text. In other words, the Court’s approach might be defined as textualist if

---

145 Eskridge, Public Values, supra note [144], at 1010.
146 For example, the case Eskridge cites as paradigmatic of the best use of public values is Bob Jones University v. United States, where the Supreme Court upheld the government’s denial of tax exempt status to the university because of its racial policies. See Eskridge, Public Values, supra at 1035-36. In contrast, Eskridge was critical of several Supreme Court decisions that were inconsistent with liberal outcomes. Id. at 1066 (criticizing NLRB v. Catholic Bishop).
147 Eskridge writes, “The most controversial public values decisions are those where the result ‘rewrites’ the statute and negates clearly expressed legislative expectations that have not been undone by substantially changed conditions.” Id. at 1066 (emphasis in original).
148 Professor John Manning, the most prominent academic textualist, writes: “[M]odern textualists acknowledge that language has meaning only in context . . . [T]hey believe that statutory language, like all language, conveys meaning only because a linguistic community attaches common understandings to words and phrases, and relies on shared conventions for deciphering those words and phrases in particular contexts.” John F. Manning, Textualism and the Equity of Statute, 101 COLUM. L. REV. 1, 108-09 (2001).
the statute sought to “protect the disabled,” leaving those terms to be defined through litigation based on broad social norms, but the statute, particularly as illuminated by the legislative history, offered a far different textual definition.

2. Positive Political Theory.

If the particular normative theories of statutory interpretation prove unhelpful, another theory steeped in positive political theory (“PPT”) might provide some insight into the Court’s decisions. Although there are variations of the PPT approach, all models identify the Supreme Court as a strategic actor that is intent on implementing its own policy preferences. Those preferences are most commonly defined as political in nature but there is no particular reason those preferences need to be limited to policy issues, and institutional preferences have likely had a greater influence on the Court’s approach to the ADA than particular policy preferences. The idea behind PPT is that the Supreme Court is engaged in a strategic game with Congress, and to a lesser extent the President, to impose its preferences without later having those preferences overruled or modified. To keep from being overruled, the Court must stay within a policy range that will be respected by the existing Congress or the gatekeeping Congressional Committee, or which will be of sufficient importance to the President to justify a veto. An important aspect of this theory is that, in making its strategic decisions, the Court looks to the preferences of the existing Congress as opposed to those of the enacting Congress. Within law, Professor William Eskridge has developed the model most extensively with a particular focus on the civil rights decisions that prompted the Civil Rights Act of 1991, as an indication, in part, how the Supreme Court played the game poorly given that its decisions were

---

149 A common example of this methodology is found in the antitrust field where courts have applied common law reasoning to give meaning to the broad statutory language.

151 See, e.g., Frank B. Cross, The Justices of Strategy, 48 DUKE L.J. 511, 546-47 (1998) (book review) (“Nothing in the concept of judicial strategy requires the assumption that Justices are exclusive maximizers of their policy preferences . . . Far more plausible is the position that judges are concerned with a variety of ends, including ideological policy.”).

152 See Ferejohn & Weingast, supra note 149, at 270 (noting that under a positive theory “the preference configuration of the current legislature is far more important for the results of statutory interpretation than is that of the enacting legislation”).
subsequently, and relatively quickly, overruled.\textsuperscript{153} The assumptions that fuel Eskridge’s model, and those developed by others, are many and the analytical results often limited.\textsuperscript{154} Nevertheless, the model has been influential within legal scholarship and is a variant of other models developed within political science that are gaining increased attention.\textsuperscript{155} On at least a surface level, the PPT model offers considerable appeal for understanding the Court’s methodology.

The Supreme Court’s decisions have typically narrowed the scope of the ADA by redefining the core concept of disability, and the Court has done so in a way that is clearly contrary to the more expansive approach adopted by the enacting Congress. And, in terms of a game, the Supreme Court has guessed right: Congress has not sought to overturn its decisions so that the Court’s policy preferences have, for the time being, been solidified. Yet, there are at least two primary difficulties in relying on this strategic theory to explain the Court’s ADA decisions. First, many of the controversial judicial decisions have been unanimous and given the ideological diversity of the Court, it seems unlikely that the Justices would be unanimous at least in their political preferences. They might, however, be unanimous in their institutional preferences, in particular in their desire not to displace workers’ compensation remedies, or perhaps more specifically not to transform the federal courts into workers’ compensation forums, or to increase substantially the disability caseload. The Justices might also be in substantial agreement that those who wear glasses, suffer from high blood pressure, or other relatively minor conditions should not be defined as disabled, but that only suggests that the Court would desire to rewrite the statute, and would not necessarily explain any particular strategic considerations, unless there was reason to believe Congress intended those conditions to be covered.

This leads to the second concern with relying on PPT to explain the Court’s decisions. As noted previously, Congress sharply rebuked the Supreme Court with the 1991 Civil Rights Act, which was passed at about the same time as the ADA, and under a PPT approach one would expect the Supreme Court to react to that statute by curtailing its preference-impositions in light of an expected Congressional rebuke. In fact, this is what has largely occurred with Title VII, where over the last decade a chastened Supreme Court has issued a series of decisions that have

\textsuperscript{153} See William N. Eskridge, Jr., Reneging on History? Playing the Court/Congress/President Civil Rights Game, 79 CALIF. L. REV. 613 (1991). Although the referenced article most directly relates to a discussion of the ADA, Professor Eskridge developed his argument through a series of articles that were later incorporated into a book. See Eskridge, supra note 144.

\textsuperscript{154} For a balanced but skeptical review see Jeffrey A. Segal, supra note 150.

\textsuperscript{155} For a comprehensive overview of the political science literature see POSITIVE THEORIES OF CONGRESSIONAL INSTITUTIONS (K. Shespe & Barry R. Weingast eds. 1995).
advanced the interests of plaintiffs and which are clearly contrary in spirit to the rulings that prompted the 1991 Act. But simultaneous with its restrained interpretations of Title VII, the Court began to emasculate the ADA, and just to make sure Congress noticed, it took three cases in one Term and slashed them all. From this perspective it is difficult to explain why the Supreme Court would act in a restrained fashion with Title VII while interpreting the ADA narrowly and contrary to congressional intent.

Staying within Eskridge’s model, one might conclude that the Court made a judgment that Congress was unlikely to care about the ADA whereas Congress had clearly demonstrated its commitment to the interests of Title VII. While plausible, this seems highly unlikely as a strategic matter, though, again, it has turned out largely to be true. Yet, there would have been no significant basis for such a conclusion, other than perhaps looking at the sloppy language of the statute. The ADA passed with overwhelming support, typically a sign of strong congressional interest rather than disinterest, and the statute was purposefully broad in its scope. It is also unlikely that the Supreme Court would have such a strong contrary policy preference with respect to disabilities, or strong enough to risk Congressional rebuke in the same manner that had occurred with Title VII.

156 In retrospect, there have been a surprising number of such decisions, many of which were unanimous reversals of lower courts on rather straightforward issues. See, e.g., Arbaugh v. Y & H Corp., 126 S. Ct. 1235 (2006) (unanimous decision finding that the number of employees was not a matter of subject matter jurisdiction); Ash v. Tyson Foods, 126 S.Ct. 1195 (2006) (unanimously and summarily reversing 11th Circuit standard on pretext and test for direct evidence); Swierkiewicz v. Sorema, 534 U.S. 506 (2002) (unanimously rejecting heightened pleading standard for employment discrimination cases); Robinson v. Shell Oil Co., 519 U.S. 337 (1997) (unanimous decision holding the term “employee” includes former employees); Oncale v. Sundowner Offshore Serv., 523 U.S. 75 (1998) (unanimously approving of same-sex harassment theory); Reeves v. Sanderson Plumbing Products, Inc., 530 U.S. 133 (2000) (unanimously rejected pretext-plus theory). The Supreme Court’s series of sovereign immunity decisions might be seen as inconsistent with a positive portrayal, but upon reflection those cases fit the Court’s scheme. Although the Supreme Court held that the Eleventh Amendment barred enforcement of the ADA and the age discrimination statute against state entities, both of those statutes are subjected to rational basis review under the constitution. In contrast, when the Court moved to the Family and Medical Leave Act, which it treated as a gender-based statute, and thus subject to an intermediate level of scrutiny, the Court held that application to the states was consistent with the Eleventh Amendment. See Nevada Dep’t of Human Resources v. Hibbs, 538 U.S. 721 (2003) (upholding application of FMLA to states); Kimel v. Florida Bd. of Regents, 528 U.S. 62 (2000) (holding that Congress had exceeded its authority in applying ADEA to the states); Board of Trustees v. Garrett, 531 U.S. 356 (2001) (same with respect to ADA). Most recently the Court held that Title II of the ADA could be applied against the states. See Tennessee v. Lane, 541 U.S. 509 (2004).

157 Sutton, Albertson’s and Murphy were all issued on the same day.

158 Focusing on institutional concerns might explain a contrary preference, if what the Court was primarily concerned about was a rising caseload devoted to disabilities claims.
Within the PPT model, the focus would be on the Congress in place when the decisions were issued, which was decidedly more conservative than the enacting Congress, and in narrowing the scope of the statute, the Court has moved closer to the position originally staked out by a small group of conservative members of Congress.\textsuperscript{159} Shifting the focus to the contemporaneous Congress, however, does not solve the puzzle of the differing approach to Title VII. Presumably, a more conservative Congress would welcome narrower interpretations of civil rights statutes across the board, and there is no reason to think they would desire narrow interpretations of the ADA but broad interpretations of Title VII.\textsuperscript{160} One possible explanation would emphasize the different stages of statutory evolution – the Court’s interpretations of the ADA concentrate on core issues whereas Title VII is at a more mature stage of development with more tangential issues to be resolved. This interpretation might explain some of the Court’s more limited interpretations under Title VII, but it would not explain most of its recent expansive decisions including the decision last Term to adopt a broad interpretation of retaliation even in a case where the interpretation was unnecessary to the outcome of the case.\textsuperscript{161}

Changing the focus of the strategic interaction to the Court’s institutional interests, combined with the lack of a prominent social movement regarding disability may help explain what the Court has accomplished, and why it has done so. As noted earlier, there is simply no way to identify the Court’s decisions as consistent with any principled method of interpretation: the Court adopts EEOC interpretations when they support the decision and ignores them when they do not, and these are interpretations from the very same agency operating under the very

Yet, during this same time period, Title VII claims tripled and this sharp increase in cases did not prompt restrictive interpretations. See Michael Selmi, Public vs. Private Enforcement of Civil Rights: The Case of Housing and Employment, 45 UCLA L. REV. 1401 (1998) (discussing increase in employment caseload).

\textsuperscript{159} The House shifted from Democratic to Republican-control with the 1994 elections, and many of the new members were quite conservative. For one of the many books chronicling the changeover see NICOL C. RAE, CONSERVATIVE REFORMERS: THE REPUBLICAN FRESHMAN AND THE LESSONS OF THE 104\textsuperscript{TH} CONGRESS (1998).

\textsuperscript{160} Similarly, if the Supreme Court was weighing the preferences of the current Congress when it issued its decisions, it might have taken the opportunity to render restrictive interpretations of Title VII so as to preserve its decisions that were overturned in the Civil Rights Act of 1991.

\textsuperscript{161} Burlington Northern v. White, 126 S. Ct. 2405 (2006) (unanimously adopting broad definition of retaliation even though plaintiff had prevailed in lower court on more restrictive definition). Several years earlier, in Desert Palace v. Costa, 539 U.S. 90 (2003), the Supreme Court unanimously held that the mixed motives theory, in which a plaintiff can prevail by establishing that an illegitimate motive was a substantial motivating factor in an employment decision, was not limited to cases of direct evidence. In Price Waterhouse v. Hopkins, 490 U.S. 228 (1989), Justice O’Connor had written an influential concurring opinion stating that the theory should only be available in cases that involved direct evidence.
Interpreting the ADA

same congressional authorization. The Court emphasizes statutory language and sentence structure in some cases but turns its eye on clear language in others, and yet all of the decisions appear to be consistent with broad social norms and institutional concerns. While there is very little helpful empirical data on the specific questions, it seems fair to suggest that most people would not define those who wear glasses or who have high blood pressure as disabled, at least in any broad sense, just as it is likely true that most individuals would agree that those who are HIV-positive should be defined as disabled. Institutionally, the Court has a strong interest in not opening the federal litigation doors to workers’ compensation claims, which are otherwise confined to lowly administrative courts, and at least some members of the Court likely have a political policy preference to limit the number of claims employers are likely to face. But it is important to emphasize that the Supreme Court decisions are not simply the product of a conservative Court seeking to trump legislative preferences with its own policy preferences. Rather, the Court has reconstructed the statute consistent with broad norms of protections society would provide; it is perhaps the statute Congress should have written, and would have written if there had been pressure to do so.

B. The Importance and Absence of a Social Movement.

Although the Court’s interpretations may bring the statute closer to the policy preferences of the current Congress, the real freedom to rewrite the statute did not come from Congressional preferences, or the lack thereof, but the absence of any social movement demanding legislative changes. Congress is not likely to move to overturn judicial decisions without significant pressure from interest groups, and that is particularly true with the ADA given that the Court’s decisions have generally favored the business community, which lost out in the original statutory play but which remains a strong legislative force. In the context of the ADA, there is simply no substantial lobbying force to push statutory

162 Whether the Court has, in fact, moved closer to the preferences of the current Congress is difficult to know without some tangible evidence of those preferences, especially in light of the strong support among Republicans the original legislation received. It is perhaps more accurate to suggest that the Court has moved closest to the preferences of those minority members of Congress who opposed the ADA but that, too, is a difficult estimation to make. Professor Einer Elhauge has recently advocated an approach to statutory interpretation that emphasizes tracking current legislative preferences over those of the enacting legislature. See Einer Elhauge, Preference-Estimating Statutory Default Rules, 102 COLUM. L. REV. 2027 (2002). Like Bill Eskridge’s dynamic theory discussed earlier, Elhauge’s theory seems best suited for updating older statutes rather than interpreting contemporary ones. Indeed, Elhauge’s theory would be difficult to implement any time Congress alters its political balance, as it can easily do every two years. For a perceptive critique of Elhauge’s theory see Amanda L. Tyler, Continuity, Coherence, and the Canons, 99 NORTHWESTERN U. L. REV. 1389 (2005).
This leads to one final lesson to be drawn from this case study regarding the importance of social movements. The last few years have seen a surge of interest within legal scholarship regarding the importance of social movements in the pursuit of equality. Traditionally the social movement literature has identified legal action as in tension with social change, with law frequently seen as disruptive to more meaningful political action. More recently, legal scholars have emphasized the interrelation between effective social movements and legal action. Professor Bill Eskridge has explored the relationship as it applies to constitutional law, with a particular focus on gender and race movements, as well as the development of social change in the area of sexual orientation. In his classic work on the pay equity movement, Michael McCann demonstrated how legal actions can energize social movements resulting in significant political progress even when those legal actions ultimately fail, as they typically did in the context of the comparable worth movement he studied. Within antidiscrimination law, three areas where substantial progress has been made over the last few decades – sexual orientation, sexual harassment and affirmative action – all had parallel social movements that supported the development of an effective legal strategy. Social change, Eskridge and others have concluded, requires both legal action and a coherent social movement.
The experience with the ADA supports this emerging claim, as the lack of an effective social movement influenced both the development of the original legislation and its subsequent interpretation. With greater social pressure, Congress may have drafted more specific legislation, or at least addressed some of the imminent issues more clearly, such as the question of mitigating measures or the potential conflict with workers’ compensation laws. It is also possible that a coherent movement would have arrived at a more specific definition of disability, rather than one that could accommodate any or all conditions. A social movement devoted to increasing public awareness about disabilities and the many ways in which our society is constructed based on a limited norm of ability might also have affected the normative vision the Supreme Court brought to its interpretive task. In contrast, it was unrealistic to expect to alter the very definition of disability by simple legislative action, just as it was unrealistic to expect the Supreme Court to allow the Suttons to go forward with their claim as a way of protecting other more deserving claims. Instead, as this case study demonstrates, the Supreme Court remains steeped in an outdated notion of disability, one that emphasizes limitations rather than abilities and sees the disabled as deserving of protection rather than independence.

Too frequently we think of the Supreme Court as apart from, or above, broader social norms or movements, even though we are repeatedly reminded that the Court most commonly mimics rather than transforms social norms. As Robert Post has recently written regarding constitutional decisions, courts work “within the web of cultural understandings that it shares with the society that it serves.” This is not to say that courts cannot influence society or prevailing social norms, but rather the influence typically works in both directions, as was particularly apparent in the recent battle over affirmative action. In the University of Michigan cases, there seems little question that the amicus briefs filed by elite universities and powerful figures had a profound effect on the Court’s ultimate determination, just as the Court’s approval of affirmative action in Bakke influenced elite public opinion. But when the work of social change is left exclusively to the courts, advocates are almost certain to be disappointed in the ultimate results.

– the damage provisions added to Title VII were a direct result of the lack of remedies for many claims of sexual harassment under the equitable remedies model. Sexual harassment claims thereafter increased dramatically, as did business concern and judicial attention. As a result, many like Yale Professor Vicki Schultz now claim that sexual harassment law has gone too far in ridding sexuality from the workplace. See Vicki Schultz, The Sanitized Workplace, 112 Yale L.J. 2061 (2003).

168 Eskridge, supra note 165, at 2406-07.

170 See Brown-Nagin, supra note 164, at 1526.
This is not to say that there has not been an important disability rights movement that has made a significant social impact. In the early 1970s, the Independent Living movement proved extremely successful in deinstitutionalizing many of those who lived with disabilities but were capable of living outside of an institutional setting. The next decade saw the emergence of ADAPT, which focused on the inaccessibility of public transportation and engaged in various protests around the country designed to highlight that inaccessibility. The protests centered at Gallaudet University succeeded in producing a deaf President for the first time in the school’s history and last Fall student protests again prompted the board to alter its Presidential choice. All of these movements, however, were limited in their focus and none sought to expand the definition or concept of disability; in fact, all were centered around traditional disabilities. Equally important to the future of the ADA, none of the movements sought to integrate workplace issues into the protests and none spawned a broader or sustained group that could carry on the work beyond the targeted issues.

In the end, without a broader social movement pushing to alter the public consciousness of disability, there was simply no reason to expect that the Supreme Court would interpret the statute expansively and many reasons to expect that they would do so narrowly. Many of the difficult interpretive issues surrounding what constitutes a disability involve contested social meanings, and, as noted previously, it seems that the Supreme Court has tracked public opinion in defining the scope of the ADA. In order to transform our definition of disability, it is necessary first – or at least simultaneously -- to alter the public imagination. Courts can assist in that effort but they cannot do all the work.

V. CONCLUSION.

The first decade of experience under the ADA provides important lessons for the way in which we think about the power and limits of courts. The Supreme Court has interpreted the ADA narrowly, but as discussed extensively above, those interpretations were both predictable and appear consistent with the reigning definition of disability. The statute’s effort to transform that definition, to transform our imagination, has largely failed, even though we have made significant progress on many disability issues. Many might be critical of the legislative nature of the Court’s actions – but those actions were likewise inevitable, particularly when confronted with a

173 See note 75 supra.
poorly drafted statute and a disinterested Congress. Whether the Court has been engaged in a strategic game with Congress to enforce its own preferences is a difficult conclusion to draw. It is, however, relatively easy to conclude that the Court’s decisions are not the product of any particular theory of interpretation. It is also likely that what the Supreme Court has done has been fully consistent with Congressional expectations, assuming those expectations were to provide protections for those traditionally defined as disabled without significantly transforming that definition. This is obviously substantially less than what the disability advocates had envisioned, or what they might argue Congress enacted, but without a broader social movement, without broader public involvement in the legislative process, the statute the Court has reconstructed may be the best we can expect.
